† These two authors contribute equally to this work.

In the original publication [1], there was a mistake in Figure 8 as published. There was no Y-axis for the XRD patterns and FTIR spectra. We have redone the experiments and converted the data in a better manner. The corrected Figure 8 appears below, which is based on newly repeated experiments.

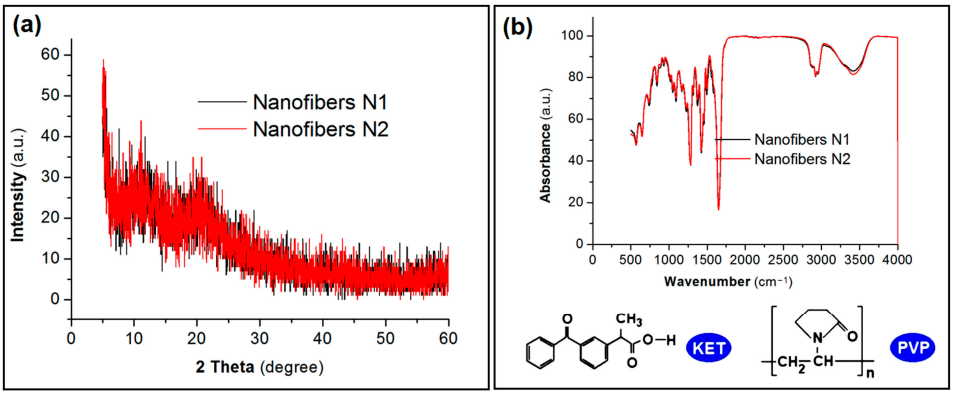

Figure 8. XRD patterns (**a**) and ATR-FTIR spectra (**b**) of nanofibers N1 and N2.

The reasons for the previous lack of a Y-axis for XRD patterns have been explained in another correction of [2]. We repeat them as follows: (1) Here, XRD and FTIR are qualitative analyses; (2) the only meaning of XRD patterns is to disclose the physical state of drug molecules in the electrospun nanofibers by the presence or absence of sharp Bragg peaks [3–8], and the only meaning of FTIR spectra is to disclose the compatibility between KET and PVP; (3) sampling is not identical for all the samples; (4) the physical quantity of the Y-axis is unit-less intensity, and its values and related noises have no scientific meaning, suggest nothing, form no judgments, and have no influence on the conclusions; (5) it is often very hard to include all XRD patterns into one figure using the same scale range, or in doing so some XRD patterns become straight smooth lines; and (6) numerous publications have no Y-axes for their XRD patterns and also no FTIR spectra [9–11]. However, the presence of a Y-axis may make the readings of XRD patterns and FTIR spectra easier for the readers.
