The journal retracts the article "Estimating Non-Stationary Extreme-Value Probability Distribution Shifts and Their Parameters Under Climate Change Using L-Moments and L-Moment Ratio Diagrams: A Case Study of Hydrologic Drought in the Goat River Near Creston, British Columbia" [1] cited above.

Following publication, the authors notified the Editorial Office regarding scientific errors affecting the validity of the work presented in this article [1].

In accordance with the journal's standard procedures, an investigation was conducted by the Editorial Office and the Editorial Board, which confirmed the presence of significant errors in the sign of the GEV shape parameter and several numerical coefficients in Equations (22)–(25) that led to inaccuracies in the reported research findings [1]. Although the authors cooperated with the investigation and proposed a correction, the Editorial Board concluded that the extent of the necessary revisions exceeded what could be addressed through a standard correction. As a result, the Editorial Board decided to retract this article in line with MDPI policy on retraction.

This retraction was approved by the Editor-in-Chief of the journal *Hydrology*.

The authors have been informed of this retraction and have indicated their agreement with this decision.
