Figure S2. Sensitivities of compared simplex (RT-) PCR for citrus tristeza virus (CTV), citrus tatter leaf virus (CTLV) and *Candidatus* Liberibacter asiaticus (*C*Las) using 10-fold serial dilutions of total nucleic acids from infected plants. These methods were described by [22], [23] and [21], respectively. Lane 1: 10^0; lane 2: 10^{-1}; lane 3: 10^{-2}; lane 4: 10^{-3}; lane 5: 10^{-4};N, negative control (ddH_2O.)
