Figure S3.

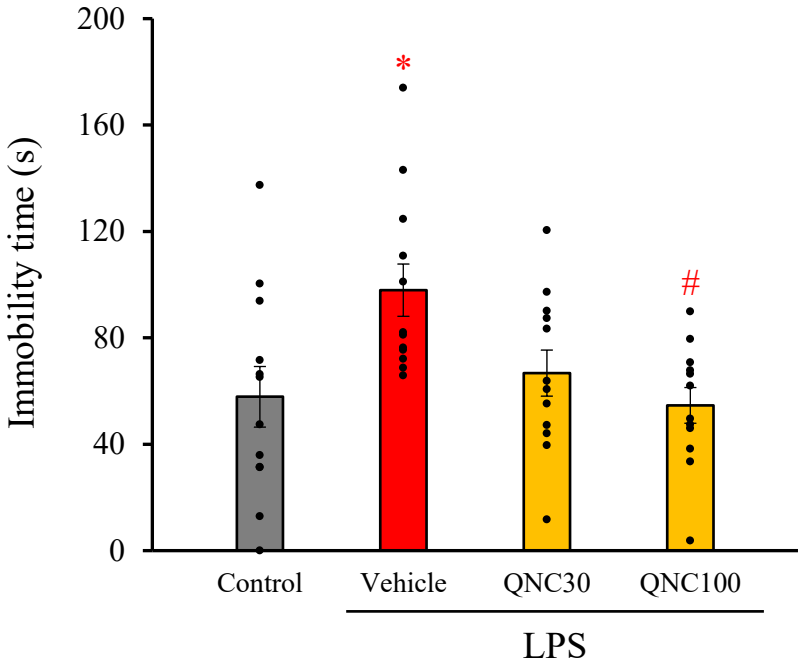

Figure S3. Effects of post-treatment with quinacrine (QNC) on lipopolysaccharide (LPS)-induced depression-like behavior in mice.

The forced swim test was performed 24 hr after LPS administration. QNC (30 and 100 mg/kg, s.c.) was administered 40 min before the forced swim test. Each column shows the mean ± S.E.M. of 12 mice. $^{*}p < 0.05$, vs. Control group, $^{\#}p < 0.05$ vs. LPS group.
