Supplementary data: Effects of Red Light and Photodynamic Pre-irradiation on the Antibacterial Effectiveness of Antibiotics against *Klebsiella pneumoniae*

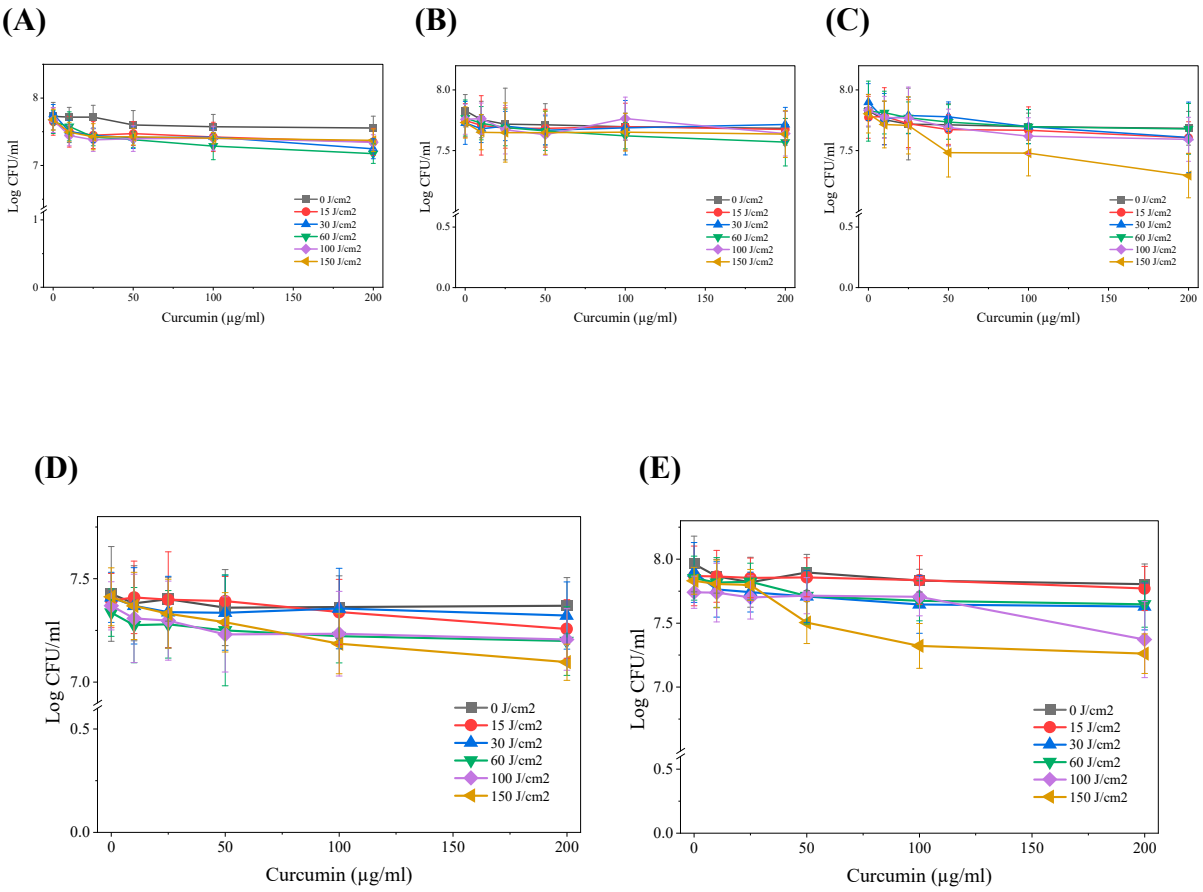

Figure S1: The effect of PDT with curcumin against *Klebsiella pneumoniae*. Incubation period of 20 min (**A**), 40 min (**B**), and 60 min (**C**). Effect of surfactants on the activity of PDT with curcumin against *K. pneumoniae*. 0.2% sodium dodecyl sulfate (SDS) (**D**), 2% Tween 80 (**E**). The graph shows colony-forming units (CFU/ml) as a function of function of curcumin concentrations (µg/ml) at an energy dose of 15 to 150 J/cm^2. Statistical significance was determined by comparing treated groups to the general control group for each concentration. Error bars represent standard deviation across replicates.
