Supplementary Figure S1. Percentage of HEK-293 cells transfected with PRPF31-GFP/N-MSiNPs. Cell nuclei were stained with DAPI to quantify the total number of cells in each replicate, and the number of GFP-positive cells was quantified. The graph shows the percentage of GFP-positive and GFP-negative cells in three replicates. The estimated mean of transfection efficacy was 19%. Cell nuclei counting was performed with ImageJ software.
