**Abstract:** Several 2-unsubstituted thieno[2,3-d]pyrimidines have been prepared from 2-aminothiophene-3-carboxylic acid esters and their carbonitrile analogs. Some triazolo-thienopyrimidine and 2-thioxothienopyrimidine representatives have also been synthesized using thermal and microwave (MW) irradiation techniques. Structures of the prepared compounds were elucidated on the basis of IR, NMR, 2D NMR and mass spectral data. The biological activity of some selected synthesized compounds was also examined.

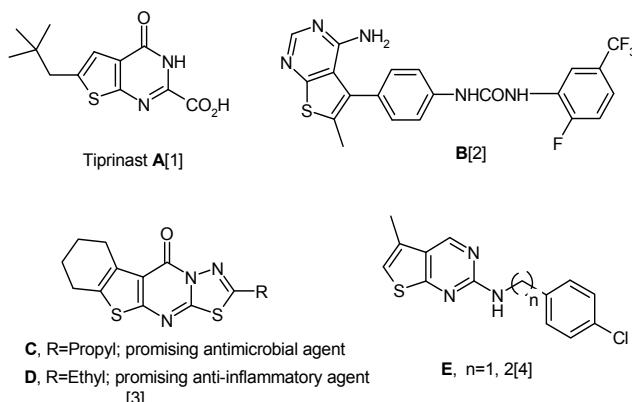

**Keywords:** thienopyridines; triazolothienopyrimidines; antibacterial activity; cytotoxic activity

### 1. Introduction

Heterocycles containing the thienopyrimidine moiety (Figure 1) are of interest because of their interesting pharmacological and biological activities [1–6]. Thus, over the last two decades many thienopyrimidines have been found to exhibit a variety of pronounced activities, for example, as antiinflammatory [3,7], antimicrobial [3,8], antiviral [9] and analgesic [7,10] agents. Some thienopyrimidine derivatives showed good antitumor activity [11], while compounds with the general structure designated by E (Figure 1) showed potent and specific cytotoxicity against several leukemia cell lines [4]. Motivated by the aforementioned biological and pharmacological importance of the title

compounds, and as continuation with our previous work on thienopyrimidines [12,13], we report herein the synthesis of some new heterocycles incorporating a thienopyrimidine moiety. Representative compounds among the synthesized thienopyrimidines were tested and evaluated as antibacterial agents and for cytotoxicity against some cancer cell lines.

## 2. Results and Discussion

### 2.1. Chemistry

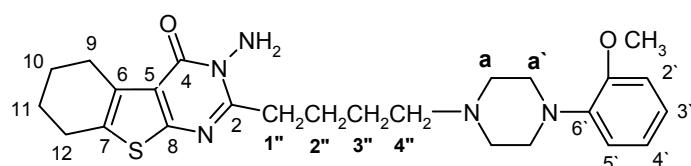

The synthetic pathways depicted in Schemes 1–4 outline the chemistry of the present study. Thus, the 2-amino-3-thiophene carboxylic ester starting materials **1a–d** and **32a,b** are easily prepared following the well established procedure reported in the literature [14,15]. Treatment of **1a,b** with  $\text{ClCO}(\text{CH}_2)_4\text{Cl}$  gave the corresponding amides **2a,b**, which in turn gave compounds **3a,b** upon refluxing in DMF with 1-(methoxyphenyl)piperazine in the presence of potassium carbonate (Scheme 1). The IR spectra of **2a,b** and **3a,b** showed two peaks in the 1,675–1,678  $\text{cm}^{-1}$  and 1,658–1,662  $\text{cm}^{-1}$  range corresponding to ester and amide carbonyl absorptions, respectively. The structure of the unPreviously unknown **2a,b** and **3a,b** were unambiguously assigned on the basis of their NMR and MS data (see Experimental). Reaction of **3a,b** with hydrazine in hot methanol led to cyclization to the corresponding thienopyrimidines in moderate yields. The IR spectra of **4a,b** exhibited a strong peak corresponding to the carbonyl group at 1,672–1,680  $\text{cm}^{-1}$ . The  $^1\text{H-NMR}$  spectrum of **4a** in  $\text{CDCl}_3$  showed a broad singlet at  $\delta$  4.96 ( $\text{NH}_2$ ), a methoxyl proton singlet and four aromatic proton resonances (Table 1). This spectrum also showed the presence of the cyclohexane and piperazine ring methylene protons as well as the butyl moiety, as judged from the DEPT spectrum. The mass spectrum of **4a** showed a prominent molecular ion peak [ $\text{M}^+$ ] as the base peak and a fragmentation pattern consistent with its structure. The  $^{13}\text{C-NMR}$ , combined with the DEPT spectrum of **4a**, confirmed the existence of 25 carbons, including a benzene ring, 12 methylene carbons (10 signals, taking in consideration the equivalency of methylene protons in the piperazine ring), methoxyl and thienopyrimidine carbons. HMBC spectroscopy (Table 1) were used to elucidate the structure and to establish the complete NMR assignments of **4a**. Starting from H-2` the most shielded aromatic proton, showed two-bond correlations with C-1` and C-3`, and showed three-bond correlations with C-4` and C-6`. H-5` and

methoxyl protons showed three-bond correlations with C-1'. Further, H-5' and C-a' of the piperazine ring showed respectively two-bond and three-bond correlations to C-6'.

A two bond-correlation observed from  $\alpha'$ -CH<sub>2</sub> to C-a, established the assignments of the chemical shifts of the piperazine ring methylene groups. H-1'' and the amino protons showed two-bond and three-bond correlations with C-2, respectively. The three-bond correlation from  $\alpha$ -CH<sub>2</sub> to C-4'' assigned the chemical shifts of the butyl protons in compound **4a**. On the other hand, the 9-CH<sub>2</sub> showed three-bond correlations with C-5 and C-7 and two-bond correlations with C-6 and C-10, while 12-CH<sub>2</sub> exhibited three-bond correlation to C-6 and two-bond correlations to C-7 and C-11 carbons. These correlations unequivocally confirmed the assignments of all carbons of the cyclohexane and thiophene rings. The signal at  $\delta_C$  141.34 must correspond to C-8 since this carbon has no correlation with any protons in the HMBC spectrum of **4a**. The mass spectrum of **4b** exhibited a molecular ion peak at *m/z* 481. Its NMR spectral data are similar to the corresponding data of **4a** with an additional  $\delta_H$  at 1.82 and  $\delta_C$  at 23.11 for the methylene group.

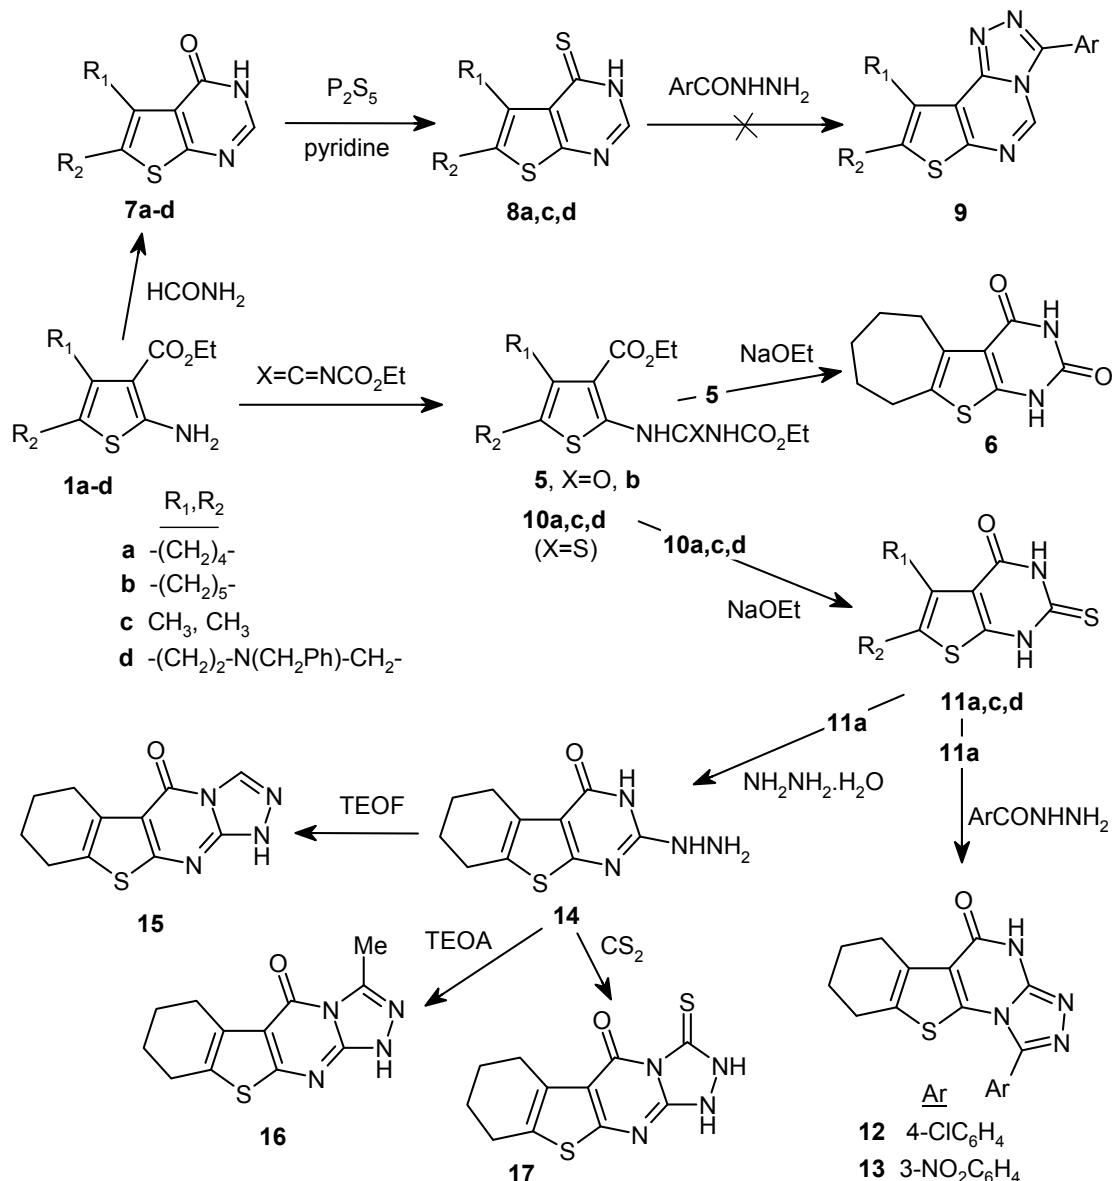

In another pathway, thienopyrimidine dione **6** and the 2-unsubstituted-thienopyrimidines **7–9** have been synthesized as depicted in Scheme 2. The structures of **6–8** were elucidated on the basis of their various spectral data (see Experimental), including their mass spectral data which were consistent with the proposed structures. Compound **8** failed to give the condensation product **9**. None of the thienopyrimidines in Scheme 2 were previously prepared, with the exception of **7a,b** [13]. The <sup>1</sup>H-NMR spectrum of **8a** revealed two singlets at  $\delta$  7.62 and  $\delta$  13.14, each integrating for one proton, corresponding to the protons at position 2 and for the NH, respectively. Compounds **11a,c,d** were synthesized from **10** upon treatment with sodium ethoxide. The IR spectra of **11a,c,d** are characterized by two bands in the 1,664–1,681 cm<sup>-1</sup> and 3,157–3,427 cm<sup>-1</sup> range due to the C=O and NH stretching frequencies, respectively. These spectra also showed a band in the 1,110–1,174 cm<sup>-1</sup> range, which corresponds to the C=S absorption in **11**. <sup>13</sup>C-NMR spectra of the latter compounds revealed two signals at around  $\delta$  173 and 157 which were attributed to the C=S and C=O, respectively, in addition to the other carbon signals at the expected values. Two singlets at  $\delta$  4.43 and 4.24 in the <sup>1</sup>H-NMR spectrum of **11d**, each integrating for two protons, correspond to the CH<sub>2</sub> of the benzyl group and the CH<sub>2</sub> at position 2 of the piperidine moiety in the molecule, respectively. This spectrum also displayed other two multiplet signals at  $\delta$  3.15 (CH<sub>2</sub>) and  $\delta$  3.39 (CH<sub>2</sub>) in addition to the signals of the protons for two NH groups at  $\delta$  11.40 (br s) and  $\delta$  12.50.

Compound **11a** reacted with hydrazine to give the corresponding hydrazino derivative **14** which in turn was transformed into the pyrazolothienopyrimidines **15–17** upon treatment with triethyl orthoformate, triethyl orthoacetate and carbon disulphide. A singlet at  $\delta$  9.01 in the <sup>1</sup>H-NMR of **15** corresponds to the proton in the triazole ring, while a singlet at  $\delta$  2.98 in the similar spectrum of **16** corresponds to the methyl substituent in the latter heterocyclic ring. Other than that, the data of both spectra were almost identical. Expected <sup>13</sup>C-NMR chemical shifts for both compounds were observed (see Experimental).

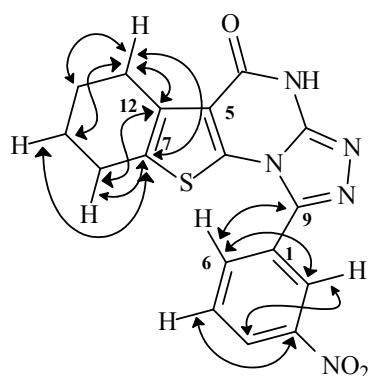

The condensation products **12** and **13** were also obtained upon treatment of **11a** with some aromatic hydrazides, as elaborated in Scheme 2. Accordingly, cyclization of **11a** to the triazolo-derivatives **12** and **13** occurred through the NH at position 1, as shown by the HMBC spectrum of **13** which indicated a two bond correlation of the hydrogen of NH at position 3 to the C-4, and in fact this would be the expected case where the latter NH is an amide. A literature survey revealed that these condensed thienopyrimidines **12–17** have not been previously prepared, and their NMR spectral data were in full agreement with the proposed structures. The assignment of the various carbons in the <sup>13</sup>C-NMR

spectra of **12–17** was accomplished with the aid of DEPT-135 and HETCOR experiments. The HMBC correlations of **13**, helpful in the assignment of chemical shifts, are shown in Figure 2.

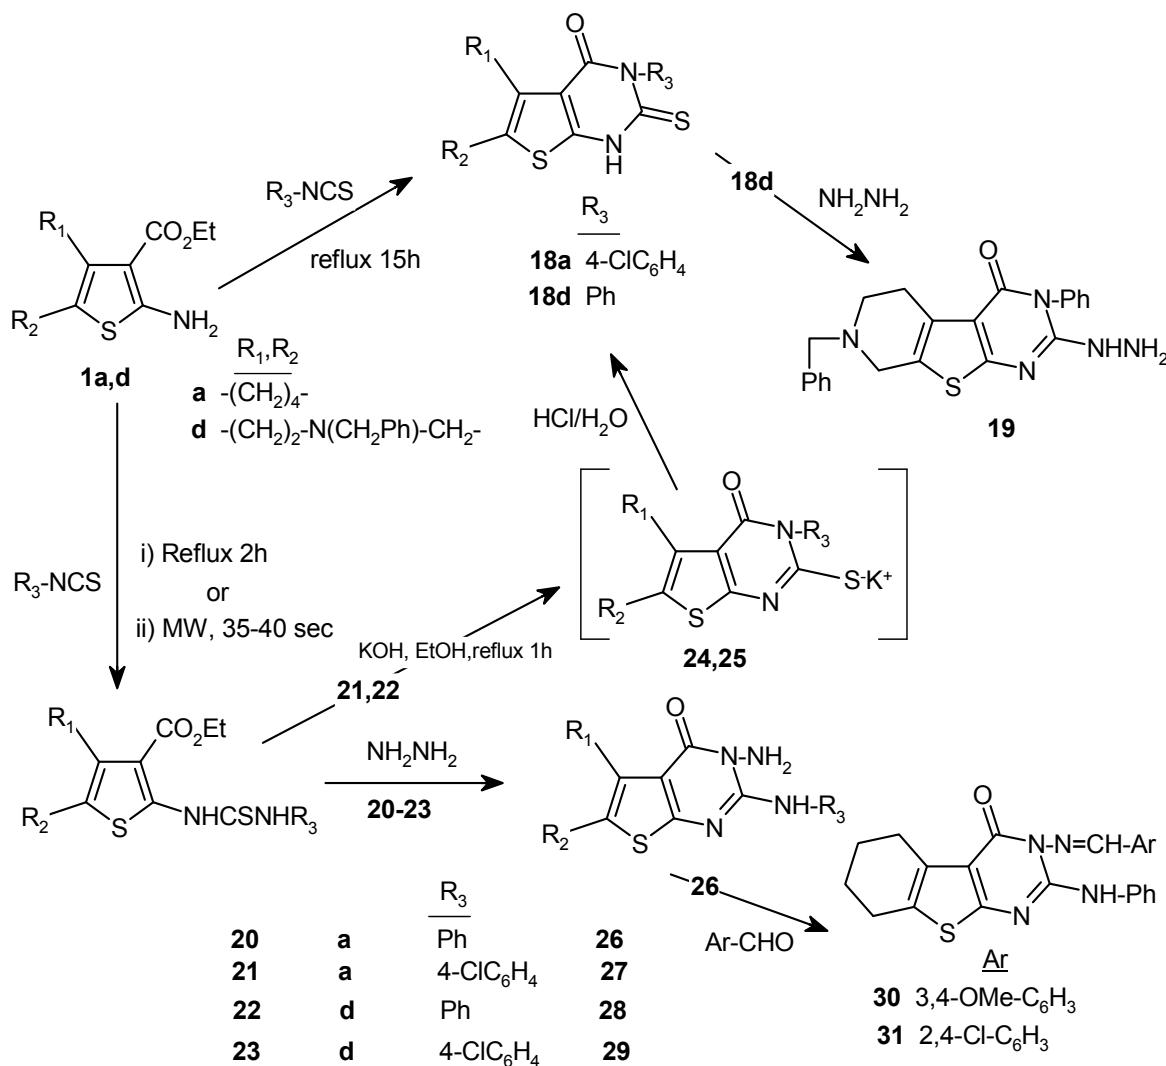

**Scheme 2.** Synthesis of compounds **5–17**.

**Figure 2.** Selected HMBC spectrum of **13**.

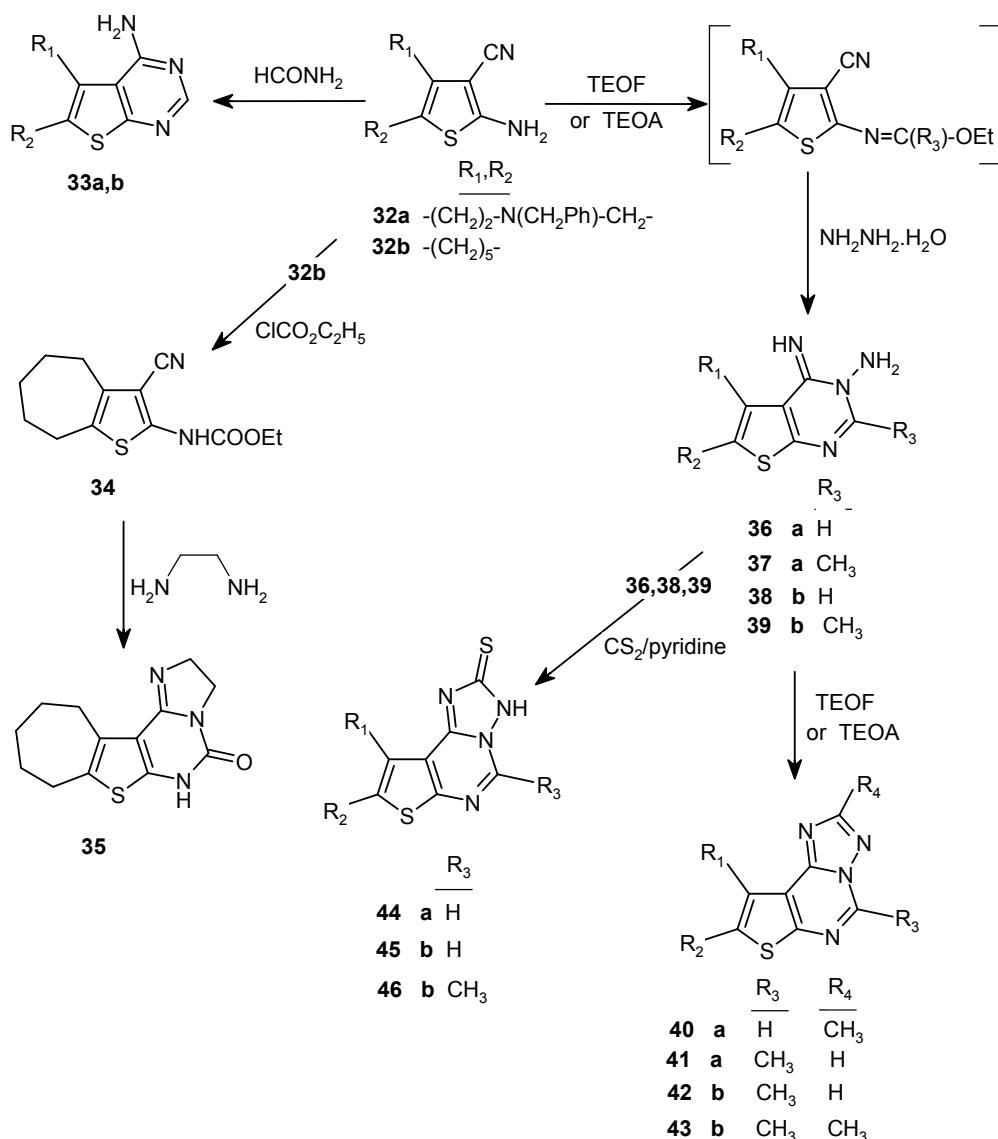

Scheme 3. Synthesis of compounds 18–31.

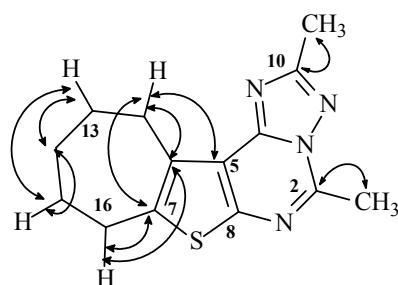

The thioureido derivatives **20–23** were obtained in moderate yields upon reaction of **1a,d** with some aromatic isothiocyanates using either the classical heating method [12] or microwave irradiation [13], although the reaction was cleaner in the case of the latter method (Scheme 3). Thioureido compounds **21** and **22** were transformed to thienopyrimidine **18** through the corresponding pyridinium salts **24** and **25**, respectively. Compounds **18a,d** were obtained directly, although in low yields, on refluxing **1a,d** with the aromatic isothiocyanates for longer times. Condensation of **18d** with hydrazine hydrate gave the novel 2-hydrazino derivative **19**. Compounds **20–23** were also condensed with hydrazine hydrate to give the corresponding 3-aminothienopyrimidines **26–29**. The latter amines reacted smoothly with aromatic aldehydes, as exemplified by the reaction of **26** with two different aldehydes. Thienopyrimidines **28–31** have not been previously synthesized and their structures were firmly established on the basis of their NMR ( $\delta_{\text{H,C}}$ ) and mass spectral data (see Experimental).

The starting 2-amino-3-cyanothiophene derivatives **32a,b** reacted with formamide to give the corresponding thienopyrimidine derivatives **33a,b** (Scheme 4). Structural elucidation of the latter was based on the various spectroscopic methods and comparison of the NMR data of **33b** with those given in the literature [13] for the same compound.

**Scheme 4.** Synthesis of compounds **32–46**.

Further, condensation of **32a,b** with TEOF and TEOA followed by hydrazine hydrate led to the formation of the novel thienopyrimidines **36–39**, whose structures were elucidated from their IR, NMR and MS spectral data (see Experimental). Compounds **40–43** were obtained in moderate yields upon the reaction of **37–39** with TEOF and TEOA. Reaction of **36**, **38** and **39** with carbon disulphide in pyridine gave the condensed thienopyrimidines **44–46**. The structures of **42–46** were confirmed from their <sup>1</sup>H-NMR, <sup>13</sup>C-NMR and mass spectral data. The assignment of the NMR chemical shifts of the thienopyrimidines were made on the basis of COSY <sup>1</sup>H-NMR and DEPT-135 experiments. HETCOR and HMBC spectra were further used in the structural elucidation of **38**, **43**, **45** and **46**. Thus, the <sup>1</sup>H-NMR spectrum of **43** displayed four multiplets and two singlets in the aliphatic region attributable to the protons in five methylenes and two methyl groups. The signals of these aliphatic carbons in the <sup>13</sup>C-NMR spectrum were verified through the corresponding DEPT-135 technique. The remaining signals in the latter spectrum correspond to the aromatic carbons in **43**, which were unambiguously assigned on the basis of the analysis of HETCOR and HMBC spectral data. Figure 3 shows the HMBC spectrum correlations in **43**.

### 2.2.1. Antibacterial screening

Representative microbes [*Staphylococcus aureus* (ATCC 25923), *Klepsela monas*(ATCC 700603), *Pseudomonas aeruginosa* (ATCC 27584) and *Escherichia coli* (ATCC 25922)] were used as test organisms. The filter paper disc method [16,17] was used for the antimicrobial screening of selected compounds (**4a**, **8c**, **12**, **15**, **17**, **41** and **46**). The tested compounds were dissolved in a suitable solvent (the concentration of the compounds was 10%). Standard blank paper discs (5 mm in diameter) were separately soaked in the solutions of each compound and after 3-5 min transferred onto the surface of growth media seeded with the test organism. After an incubation period under suitable conditions for the test organism (35 °C) and after 24 h, the diameter of the inhibition zones around the discs were measured in millimeters. The effects were compared with the reference antibiotics vancomycin (VA) in the case of *S. aureus* and cefatrizidine (CAZ) in the case of other tested organisms. The antibiotics VA and CAZ were used at a concentration of 20 mg/mL as references. The obtained results are summarized in Table 2. Most of the compounds (except **17**) showed very good activity against *Staphylococcus aureus* comparing with the used reference standards. Some of the tested compounds showed very weak or moderate activities against *Klepsela monas*, *Pseudomonas aeruginosa* and *Escherichia coli*, as can be noticed from Table 2.

## 2.2.2. Antitumor studies

The synthesized thienopyrimidines **4a**, **7d**, **8a**, **12**, **15**, **29** and **42** were tested against the following human tumor cell lines: colorectal carcinoma (HCT116), hepatocellular carcinoma (HEPG2), cervix adenocarcinoma (HELA), larynx carcinoma (HEP2), human breast adenocarcinoma (MCF7). The drug doxorubicin [18] has been used as a reference in the present study to compare the inhibition effect for tested compounds on the growing cancer cells. Measurement of Potential Cytotoxicity by the SRB Assay was used [19]. Compounds **8**, **12** and **29** showed very good anticancer activity against HEPG2, while most of the compounds were very active against HELA, except **4a** and **7d**. Compounds **7d** and **15** were active toward MCF7. For cell line HCT116 only **7d** and **42** were very active, on the other hand **7d**, **8a** and **15** were very active against HEP2. Results are summarized in Table 3.

## 3. Experimental

### 3.1. General

Melting points were determined on an Electrothermal IA9000 series digital capillary melting point apparatus. IR spectra were run (KBr discs) on a Shimadzu FT spectrophotometer 1000. <sup>1</sup>H- and <sup>13</sup>C-NMR spectra were recorded in DMSO-d<sub>6</sub> (or in CDCl<sub>3</sub>) on a JEOL ECP 400 NMR spectrometer operating at 400/100 MHz, with TMS as internal standard. DEPT and HETCOR experiments were recorded on a 500 MHz instrument (Bruker, J.F.B. 288) at King Saud University (Pharmacy Research Centre). Chemical shifts are given in δ (ppm) and coupling constants (J) are given in Hz. The assignments of all carbons are made by comparison to <sup>13</sup>C-NMR spectra of structurally related compounds [12,13] and theoretical grounds [20,21], and with the aid various modern NMR techniques in many cases. Electron impact (EI) MS spectra were recorded on a Shimadzu GCMSQP5050A spectrometer (DB-1 glass column 30 m × 0.25 mm, ionization energy 70 eV), at the Chemistry Department, College of Science, King Saud University. Antimicrobial and anti-cancer tests of some of the synthesized compounds were run in King Abdul Aziz Hospital for the National Guard, Al-hasa, Saudi Arabia and the Pharmacology Unit, National Cancer Institute, Cairo University, Egypt, respectively. The reactions were monitored by TLC, and the purity of the compounds were routinely checked by TLC silica gel plates while the spots were visualised by UV (Uvitec). The starting

materials, ethyl 2-amino-4,5-disubstituted thiophene-3-carboxylates **1a-d** and the 2-amino-4,5-disubstituted thiophene-3-carbonitrile **32**, were prepared by condensation of ketones, elemental sulfur, ethyl cyanoacetate or malononitrile as described [14,15].

### 3.2. General procedure for synthesis of **2a,b**

Compounds **2a,b** were both prepared according to a method reported in the literature [22] for similar compounds. 5-Chlorovaleryl chloride (1.3 mL, 10 mmol) was added to a solution of amino ester **1a,b** (10 mmol) in chloroform (20 mL) and the solution was refluxed for 4 h. After cooling, the solution was concentrated under reduced pressure to give a dark oil. Addition of a small amount of water and ethanol yielded a solid that was collected, dried and recrystallized from ethanol.

### 3.3. 2-[5-(4-(2-Methoxyphenyl)-1-piperazin-1-yl)pentanoylamino]-4,5,6,7-tetrahydrobenzo[b]-thiophene-3-carboxylic acid ethyl ester (3a)

A mixture of **2a** (3.9 mmol), 1-(2-methoxyphenyl)piperazine (750 mg, 3.9 mmol), and potassium carbonate (540 mg, 3.9 mmol) was dissolved in DMF (7 mL) and refluxed under stirring for 2 h. After cooling, the suspension was filtered and the solution was extracted with chloroform and washed with water. The organic layers were dried over anhydrous sodium sulfate and evaporated under reduced pressure. Recrystallization from ethanol gave white crystals, m.p. 105–106 °C; yield 94%; IR ( $\text{cm}^{-1}$ ): 3,261 (NH), 1,691 (CO, ester), 1,660 (CO, amide);  $^1\text{H-NMR}$  ( $\text{CDCl}_3$ )  $\delta$ : 1.34 (3H, t,  $J = 7.32$  Hz,  $\text{CH}_2\text{CH}_3$ ), 1.60 (2H, m,  $\text{CH}_2$ ), 1.75 (6H, m, 3  $\text{CH}_2$ ), 2.43 (4H, t,  $J = 7.3$  Hz, 2  $\text{CH}_2\text{-N}$  piperazine), 2.48 (4H, t,  $J = 7.3$  Hz, 2  $\text{CH}_2\text{-N}$  piperazine), 2.61 (6H, br, 3  $\text{CH}_2$ ), 2.73 (2H, br s,  $\text{CH}_2\text{-CO}$ ), 3.81 (3 H, s, O- $\text{CH}_3$ ), 4.28 (2H, q,  $J = 7.3$  Hz,  $\text{CH}_2\text{CH}_3$ ), 6.80–6.97 (4H, m, Ar-H), 11.01 (s, NH);  $^{13}\text{C-NMR}$  ( $\text{CDCl}_3$ )  $\delta$ : 22.95, 23.07, 23.40, 24.42 (4C, 4  $\text{CH}_2$  N-piperazine), 26.46, 36.80, 50.72, 53.55 (4C, 4  $\text{CH}_2$ ), 55.40 ( $\text{OCH}_3$ ), 26.46 (2 C), 58.26 (2 C) (4C, 4  $\text{CH}_2$ ), 14.41 ( $\text{CH}_2\text{CH}_3$ ), 60.50 ( $\text{CH}_2\text{CH}_3$ ), 111.30,

### 3.4. 2-(5-(4-(2-Methoxyphenyl)piperazin-1-yl)pentanamido)-5,6,7,8-tetrahydro-4H-cyclohepta[b]-thiophene-3-carboxylic acid ethyl ester (**3b**)

Compound **3b** was prepared from equimolar amounts of **2b** and 1-(2-methoxyphenyl)piperazine following the same conditions and work up described for the preparation of **3a**. The product could not be induced to crystallize, although the NMR spectra proved the structure. Yield 85%; <sup>1</sup>H-NMR (CDCl<sub>3</sub>) δ: 1.72 (4H, m, 2CH<sub>2</sub>), 1.84 (2H, m, CH<sub>2</sub>), 2.55 (2H, m, CH<sub>2</sub>), 2.85 (2H, m, CH<sub>2</sub>); <sup>13</sup>C-NMR (CDCl<sub>3</sub>) δ: 19.64, 26.20, 28.62, 29.15 (2C) (cycloheptane carbons).

### 3.5. 3-Amino-2-[4-[4-(2-methoxyphenyl)-piperazin-1-yl]butyl]-5,6,7,8-tetrahydro-3H-benzo[4,5]-thieno[2,3-d]pyrimidin-4-one (**4a**)

A mixture of **3a** (20 mmol) and hydrazine hydrate (4 mL, 80 mmol) was refluxed for 12 h in ethanol (10 mL). After cooling, the product was collected and washed with ethanol, dried and recrystallized from ethanol, to yield **4a** colorless crystals, m.p. 163–164 °C; yield 92%; IR (cm<sup>-1</sup>): 3,273 and 3,145 (NH), 1,672 (C=O); <sup>1</sup>H and <sup>13</sup>C-NMR data: see Table 1; MS: *m/z* 467 (M<sup>+</sup>, 2.02%), 452 (M<sup>+</sup>-CH<sub>3</sub>), 18.27%), 204 (M<sup>+</sup>-(NH<sub>2</sub>, (CH<sub>2</sub>)<sub>4</sub>-N<sub>2</sub>C<sub>4</sub>H<sub>8</sub>-C<sub>6</sub>H<sub>4</sub>-OCH<sub>3</sub>)), 24.29%), 119 (M<sup>+</sup>=[C<sub>6</sub>H<sub>4</sub>-N-CH<sub>2</sub>CH<sub>3</sub>]<sup>+</sup>, 100%).

### 3.6. 3-Amino-2-[4-[4-(2-methoxyphenyl)-piperazin-1-yl]butyl]-6,7,8,9-tetrahydro-3H,5H-[4,5]thieno[2,3-d]pyrimidin-4-one (**4b**)

This compound was prepared from **3b** following the same conditions and work up described for the preparation of **4a**. Colorless crystals, m.p. 183–185 °C; yield 81%; IR (cm<sup>-1</sup>): 3310, 3135 (NH), 1670 (C=O); <sup>1</sup>H and <sup>13</sup>C-NMR data: almost the same data as **4a** above except for an additional CH<sub>2</sub> in the cycloheptane moiety in **4b**: δ<sub>H</sub> 1.79 (4H, m, 2 CH<sub>2</sub>), 1.95 (2H, m, CH<sub>2</sub>), 2.51 (2H, m, CH<sub>2</sub>), 2.87 (2H, m, CH<sub>2</sub>) and δ<sub>C</sub> 19.81, 25.14, 27.40, 29.15 (2C, cycloheptane carbons); MS: *m/z* 481 (M<sup>+</sup>, 7.3%), 466 (M<sup>+</sup> - CH<sub>3</sub>), 15.39%).

### 3.7. 2-(3'-Ethoxycarbonylureido)-3-ethoxycarbonyl-5,6,7,8-tetrahydro-4H-cyclohepta[b]thiophene (**5**)

A mixture of **1b** (1.195 g, 5 mmol) and ethyl isocyanatoformate (575 mg, 5 mmol) was placed in a 50 mL conical flask covered with a funnel glass and then irradiated with microwaves (950 W) for 35 seconds. The cold reaction mixture was treated with ethanol and the solid product was filtered and recrystallized from ethanol-water to give colorless needles, m.p. 167–169 °C; yield 88%; IR (cm<sup>-1</sup>): 3,207, 3,115 (2 NH), 1,739 (CO, ester), 1,678, 1,675 (2 CO, amide); <sup>1</sup>H-NMR (CDCl<sub>3</sub>) δ: 1.32 (3H, t, CH<sub>3</sub>), 1.36 (3H, t, CH<sub>3</sub>), 1.64 (4H, m, 2 CH<sub>2</sub>), 1.83 (2H, m, CH<sub>2</sub>), 2.71 (2H, t, CH<sub>2</sub>), 3.05 (2H, t, CH<sub>2</sub>), 4.30 and 4.40 (each 2H, q, O-CH<sub>2</sub>), 7.45 (1H, s, NH), 12.43 (1H, s, NH); <sup>13</sup>C-NMR (CDCl<sub>3</sub>) δ: 14.34 and 14.44 (each 3H, t, CH<sub>3</sub>), 27.06, 27.89, 28.35, 28.69, 32.33 (5C-5CH<sub>2</sub>), 60.72, 62.98 (2C, O-CH<sub>2</sub>), 114.22, 131.20, 137.18, 144.16 (thiophene ring), 165.52 (CO), 153.11, 149.56 (2 CO-amide);

### 3.12. General procedure for the synthesis of 11a,c,d

These substances were prepared according to a method reported in the literature [23]. Compound **10** (1 mmol) was dissolved in solution of sodium ethoxide (230 mg sodium and 15 mL of absolute ethanol) and the solution was heated under reflux for 30 min. The solvent was then evaporated under vacuum, some water was added to the residue, and the pH of the mixture was adjusted to 4 with hydrochloric acid. The product that separated was collected and crystallized from a suitable solvent.

### 3.18. Synthesis of disubstituted thienyl-2-thioureides **20-23**

#### 3.18.1. Method A

2-Amino-3-ethoxycarbonyl thiophene **1a,d** (100 mmol) was dissolved in hot ethanol (100 mL) and phenyl (or *p*-chlorophenyl) isothiocyanate (110 mmol) was added dropwise with stirring. The reaction mixture was heated under reflux on water bath for 2 h, then left to cool overnight and the separated crude solid was filtered, washed with ethanol, and recrystallized from ethanol [12].

### 3.18.2. Method-B

A mixture of **1a,d** (20 mmol) and phenyl (or *p*-chlorophenyl) isothiocyanate (20 mmol) placed in a 50 mL conical flask covered with a funnel glass and then irradiated with microwaves (950 W) for 35–40 seconds. The cold reaction mixture was then treated with ethanol and the solid product was filtered off and recrystallized from ethanol [13].

### 3.19. General procedure for the preparation of the monopotassium salts of **24** and **25**

A mixture of the compounds **21**, **22** (13.5 mmol) and potassium hydroxide (760 mg, 13.5 mmol) in absolute ethanol (55 mL) was heated under reflux with stirring for 1 h. The suspension was filtered while hot, and the solid was washed with hot absolute ethanol to give **24** [13] and **25** which were both used without any further purification.

### 3.20. General procedure for the preparation of **18a,d**

#### 3.20.1. Method A

A suspension of potassium salts of **24**, **25** in water (50 mL) was acidified with concentrated hydrochloric acid and stirred at room temperature for 30 min. The solid was collected by filtration, washed with water and recrystallized from the suitable solvent to give **18a,d**.

#### 3.20.2. Method B: Synthesis of **18d**

A mixture of **1d** (3.16 g, 10 mmol) and phenyl isothiocyanate (1350 mg, 10 mmol) in acetonitrile (30 mL) was heated under reflux for 15 h in the presence of anhydrous potassium carbonate (1.4 g). The reaction mixture was then cooled, filtered, diluted with water (10 mL) and neutralized with 2M hydrochloric acid. The product obtained was filtered, washed with water, dried and recrystallized from acetic acid.

#### 4. Conclusions

Several new thienopyrimidin-4-one(thione) derivatives were synthesized from 2-amino-3-carbethoxy (or 3-cyano)-4,5-disubstituted thiophenes as starting materials. Further, some triazolo-thienopyrimidine and 2-thioxothienopyrimidine representatives have also been synthesized, and their structures have been determined on the basis of their 2D NMR data. Some of prepared compounds were evaluated for their antimicrobial and antitumor -activities, and compounds **4a**, **12**, **15** were found to be promising antimicrobial agents, while compounds **7a**, **8a**, **15**, **29**, **42** have some activity against different human tumor cell lines.

#### Acknowledgments

One of the authors, Khulud Al-Tisan, is grateful to the College of Science at Dammam University and the College of Science at King Faisal University in Al-Ahsa, for financial support and providing all facilities for this research as part of her Ph.D thesis. The authors are thankful to KACST for support, and to the Chemistry Department at King Saud University for running all the NMR analyses. We are indebted to Abdul Aziz Al-Masaud, Ali Al-assayed, at King Abdul Aziz Hospital for the National Guard at Al-Ahsa for supplying the antibiotics and providing the facilities for the antimicrobial tests in this research.
