Abstract: An efficient and catalyst-free synthesis of trisubstituted allylic sulfones through an allylic sulfonylation reaction of Morita-Baylis-Hillman (MBH) carbonates with sodium sulfinates has been developed. Under the optimized reaction conditions, a series of trisubstituted allylic sulfones were rapidly prepared in good to excellent yields (71%–99%) with good to high selectivity (Z/E from 79:21 to >99:1). Compared with known synthetic methods, the current protocol features mild reaction temperature, high efficiency and easily available reagents.

Keywords: Morita-Baylis-Hillman carbonate; allylic sulfone; trisubstituted alkene; allylic substitution
1. Introduction

Morita-Baylis-Hillman (MBH) adducts and their derivatives are very useful multifunctional synths in organic chemistry [1–5]. Since the pioneering work of Lu and co-workers in 2004, MBH carbonates have triggered much interest among chemistry researchers [6]. The most extensively studied transformation pattern of this type of MBH derivatives is the allylic substitution with a pronucleophile in the presence of a Lewis basic catalyst [7–9]. Based on the substitution position on MBH carbonates, the transformations could be divided into the following two styles: substitution at the β-position through a SN2'-SN2' cascade or substitution at the β'-position via a single SN2' route (Scheme 1). Compared with the former route, which is widely employed in asymmetric synthesis to access versatile multifunctional chiral molecules [10–16], the latter route has been often used for the preparation of trisubstituted alkenes [17–20].

![Scheme 1](image)

**Scheme 1.** Allylic substitution reaction of Morita-Baylis-Hillman (MBH) carbonates.

Allylic sulfone derivatives are important intermediates in organic synthesis [21–24]. Recent studies have revealed that these compounds exhibit remarkable biological activities [25]. The use of MBH adducts or their acetates as good starting materials for the trisubstituted allylic sulfones has been reported in some instances [26–34]. Although many sulfonyl precursors including sulfinate [26–29], p-toluenesulfonylmethylecyanide [30], arenesulfonyl cyanide [31], sulfinyl chloride [32], sulfonylhydrazide [33] and sulfinic acid [34] have been employed in this type of allylic sulfonylation, sulfinate is undoubtedly a cheap and easily available reagent. However, either a high reaction temperature [26,27] (70–80 °C, 6–16 h) or unconventional organic solvent (ionic liquids or polyethylene glycol) [28,29], accompanied with tedious work-up procedures, were required to ensure a high yield of the desired products. Since MBH carbonates usually exhibit much superior reactivity to MBH acetates, we envisaged that they would be more susceptible to the nucleophilic attack by sulfinate. Herein, we report a new protocol in which MBH carbonates 1 and sodium sulfinates 2 undergo a smooth and rapid SN2' pathway to realize the trisubstituted allylic sulfones 3 under mild and catalyst-free reaction conditions (Scheme 2).

2. Results and Discussion

2.1. Optimization Studies

Preliminary studies were carried out by using MBH carbonate 1a (R = Ph, EWG = CO₂Me) and sodium benzenesulfinate (2a, Ar = Ph). The screening results are presented in Table 1. Firstly, the model reaction was investigated with different solvents at ambient temperature (Table 1, entries 1–6). Among the solvents tested, toluene and chloroform gave poor conversion (Table 1, entries 1 and 2), and PhCF₃ afforded only a trace amount of the final adduct 3a after 72 h (Table 1, entry 3). Although 1,2-dichloroethane (DCE) and tetrahydrofuran (THF) afforded 3a in high yield (Table 1, entries 4 and 5), acetonitrile was a superior solvent with regard to both conversion rate and product yield (92%, Table 1, entry 6). Next, it was found that when the reaction temperature was raised to 40 °C, nearly full conversion could be achieved within a significantly shortened reaction time and the expected product was furnished in 96% yield (Table 1, entry 7). Finally, the examination of the reaction with a decreased concentration of substrate 1a revealed no influence on product yield, whereas the reaction time was prolonged (Table 1, entry 8).

Table 1. Optimization of reaction conditions using MBH carbonate 1a and sodium benzenesulfinate 2a.

a Reaction conditions: Unless otherwise noted, reactions were performed with 1a (0.1 mmol) and sodium benzenesulfinate 2a (0.15 mmol) in solvent (1 mL) at indicated temperature; b Isolated yield of two inseparable isomers; c Major isomer of 3a was determined to be Z by comparison of its NMR data with the one reported in literature [35]; d Z/E = 96:4, determined by ¹H-NMR analysis; e 2 mL of solvent was used.

2.2. Synthesis of Trisubstituted Allylic Sulphones 3a–o

On the basis of the above optimized reaction parameters (0.1 mmol of MBH carbonate 1a and 0.15 mmol of sodium benzenesulfinate 2a) to perform the reaction in 1 mL of MeCN at 40 °C), this protocol was then extended to other MBH carbonates or sulfinates to investigate the scope and limitation of the method. As shown in Table 2, MBH carbonates 1 could generally be converted within 2 h and corresponding products 3 were obtained in good to excellent yields (71%–99%) with good to high selectivity (Z/E from 79:21 to >99:1) (Table 2, entries 1–15). Different substituents on the phenyl group were first explored. The results showed that the electronic nature or position of substituents had minimal influence on reaction efficiency in terms of reaction rate and product yield in general (78%–98%, Table 2, entries 1–9). Besides, 1-naphthyl group-substituted MBH carbonate 1j was a
suitable substrate, albeit with lower yield (71%, Table 2, entry 10). Meanwhile, two heteroaromatic substrates 1k and 1l also showed high reactivity, providing 3k and 3l in high yields (85% and 96%, Table 2, entries 11 and 12). It is worth mentioning that the MBH carbonate 1m, which was prepared from an aliphatic aldehyde, could participate in this reaction to produce the desired product 3m in high yield (91%, Table 2, entry 13). In addition, MBH carbonate 1n, which was derived from acrylonitrile, could also be transformed in excellent yield under the catalyst-free reaction conditions (99%, Table 2, entry 14). To our delight, sodium p-toluenesulfinate 2b (Ar = p-MeC₆H₄) was well tolerated and the desired product 3o was provided in 95% yield (Table 2, entry 15).

a Reaction conditions: Unless otherwise noted, reactions were performed with MBH carbonate 1 (0.1 mmol) and sodium sulfinate 2 (0.15 mmol) in MeCN (1 mL) at 40 °C for 2 h; b Isolated yield of two inseparable isomers; c Olefin geometry was assigned by analogy with that of 3a; d Z/E ratio was determined by 1H-NMR analysis.

3. Experimental Section

3.1. General Information

TLC was performed on glass-backed silica plates. Flash column chromatography was performed using silica gel (200–300 mesh) eluting with ethyl acetate and petroleum ether. UV light was used to visualize products. 1H-NMR spectra were recorded at 400 MHz, and 13C-NMR spectra were recorded at 100 MHz (Avance 400, Bruker, Faellanden, Switzerland). Tetramethylsilane was used as the internal standard. Chemical shifts are reported in ppm downfield from the solvent signal (CDCl₃, δ = 7.27 ppm) for 1H-NMR and relative to the central CDCl₃ resonance (δ = 77.0 ppm) for 13C-NMR spectroscopy. Coupling constants are given in Hz. ESI-HRMS was recorded on a Waters SYNAPT G2 (Milford, MA, USA). In experiments requiring dry solvents, DCE, chloroform and toluene were distilled from CaH₂. PhCF₃ was stored over 4 Å molecular sieves. THF was dried over sodium metal. Acetonitrile was...
dried over P$_2$O$_5$. All other chemicals were used without purification as commercially available. MBH carbonates were prepared by the reported procedure [36].

3.2. General Procedure for Preparation of Trisubstituted Allylic Sulfones 3a–o

MBH carbonate 1 (0.1 mmol) and sodium sulfinate 2 (0.15 mmol) were mixed in MeCN (1 mL) and heated at 40 °C for 2 h. Then, the reaction mixture was concentrated under reduced pressure and the residue was diluted with toluene and purified by flash column chromatography on silica gel (petroleum ether/EtOAc) to afford the desired product 3a–o. Products 3a [33], 3d [26], 3f [26], 3k [26], 3l [27], 3n [33] and 3o [26] are known compounds.

(Z)-Methyl 3-phenyl-2-[(phenylsulfonyl)methyl]acrylate (3a). Colourless liquid; 96% yield; Z/E = 96:4; $^1$H-NMR: $\delta$ = 7.95 (s, 1H), 7.86 (d, $J$ = 8.0 Hz, 2H), 7.63–7.59 (m, 1H), 7.52–7.47 (m, 4H), 7.39–7.37 (m, 3H), 4.49 (s, 2H), 3.60 (s, 3H) ppm; $^{13}$C-NMR: $\delta$ = 167.0, 146.6, 139.6, 133.9, 133.8, 129.9, 129.4, 129.2, 129.0, 128.7, 121.1, 55.3, 52.5 ppm; ESI-HRMS: calcd. For C$_{17}$H$_{16}$O$_4$S+Na 339.0667, found 339.0661.

(Z)-Methyl 3-(2-chlorophenyl)-2-[(phenylsulfonyl)methyl]acrylate (3b). Colourless liquid; 88% yield; Z/E = 95:5; $^1$H-NMR: $\delta$ = 7.94 (m, 1H), 7.75 (d, $J$ = 8.0 Hz, 2H), 7.55–7.61 (m, 2H), 4.31 (s, 2H), 3.55 (s, 3H) ppm; $^{13}$C-NMR: $\delta$ = 165.5, 142.4, 138.5, 133.3, 133.0, 131.5, 129.2, 129.0, 128.3, 128.1, 127.7, 126.3, 122.3, 54.2, 51.8 ppm; ESI-HRMS: calcd. For C$_{17}$H$_{15}$ClO$_4$S+Na 373.0277, found 373.0273.

(Z)-Methyl 3-(4-chlorophenyl)-2-[(phenylsulfonyl)methyl]acrylate (3c). Colourless liquid; 96% yield; Z/E = 85:15; $^1$H-NMR: $\delta$ = 7.89 (s, 1H), 7.85 (d, $J$ = 8.0 Hz, 2H), 7.53–7.49 (m, 2H), 7.46 (d, $J$ = 8.0 Hz, 2H), 7.35 (d, $J$ = 8.0 Hz, 2H), 4.44 (s, 2H), 3.57 (s, 3H) ppm; $^{13}$C-NMR: $\delta$ = 165.6, 144.0, 138.3, 134.9, 132.9, 131.1, 129.6, 128.1, 127.5, 120.4, 54.1, 51.5 ppm; ESI-HRMS: calcd. For C$_{17}$H$_{15}$ClO$_4$S+H 351.0458, found 351.0459.

(Z)-Methyl 3-(4-nitrophenyl)-2-[(phenylsulfonyl)methyl]acrylate (3d). Pale yellow solid; 83% yield; Z/E = 79:21; $^1$H-NMR: $\delta$ = 8.24 (d, $J$ = 8.0 Hz, 2H), 7.98 (s, 1H), 7.86 (d, $J$ = 8.0 Hz, 2H), 7.69–7.64 (m, 3H), 7.55–7.52 (m, 2H), 4.40 (d, $J$ = 8.0 Hz, 2H), 4.44 (s, 2H), 3.63 (s, 3H) ppm; $^{13}$C-NMR: $\delta$ = 165.0, 142.5, 139.0, 133.1, 128.8, 128.2, 127.7, 127.5, 123.2, 122.9, 122.4, 53.9, 51.7 ppm; ESI-HRMS: calcd. For C$_{17}$H$_{15}$NO$_6$S+Na 384.0518, found 384.0518.

(Z)-Methyl 3-(3-bromophenyl)-2-[(phenylsulfonyl)methyl]acrylate (3e). Pale yellow solid; 93% yield; Z/E = 94:6; $^1$H-NMR: $\delta$ = 7.85–7.83 (m, 3H), 7.68–7.64 (m, 1H), 7.53–7.42 (m, 5H), 7.28–7.24 (m, 1H), 4.46 (s, 2H), 3.67 (s, 3H) ppm; $^{13}$C-NMR: $\delta$ = 166.6, 144.6, 139.1, 135.7, 134.0, 132.6, 131.9, 130.4, 129.3, 128.7, 127.4, 123.0, 122.7, 55.0, 52.7 ppm; ESI-HRMS: calcd. For C$_{17}$H$_{15}$BrO$_4$S+Na 416.9772, found 416.9772.

(Z)-Methyl 3-(4-methoxyphenyl)-2-[(phenylsulfonyl)methyl]acrylate (3f). Colourless liquid; 78% yield; Z/E = 88:12; $^1$H-NMR: $\delta$ = 7.92 (s, 1H), 7.89 (d, $J$ = 8.0 Hz, 2H), 7.62–7.58 (m, 3H), 7.54–7.50 (m, 2H), 6.93 (d, $J$ = 8.0 Hz, 2H), 4.52 (s, 2H), 3.85 (s, 3H), 3.51 (s, 3H) ppm; $^{13}$C-NMR: $\delta$ = 167.3, 161.3,
(Z)-Methyl 3-(3,4-dimethoxyphenyl)-2-[(phenylsulfonyl)methyl]acrylate (3g). Viscous liquid; 98% yield; Z/E = 90:10; \(^1\)H-NMR: \(\delta = 7.93\) (s, 1H), 7.90 (d, \(J = 8.0\) Hz, 2H), 7.65–7.62 (m, 1H), 7.55–7.51 (m, 2H), 7.43 (s, 1H), 7.20–7.17 (m, 1H), 6.90 (d, \(J = 8.0\) Hz, 1H), 4.53 (s, 2H), 3.97 (s, 3H), 3.93 (s, 3H), 3.50 (s, 3H), ppm; \(^{13}\)C-NMR: \(\delta = 166.1, 149.8, 148.1, 145.8, 138.6, 132.7, 128.0, 127.6, 125.5, 122.7, 117.2, 111.5, 110.1, 55.3, 55.0, 54.8, 51.2\) ppm; ESI-HRMS: calcd. For C\(_{18}\)H\(_{18}\)O\(_5\)S+Na 369.0773, found 369.0771.

(Z)-Methyl 2-[(phenylsulfonyl)methyl]-3-(p-tolyl)acrylate (3i). Colourless liquid; 92% yield; Z/E = 96:4; \(^1\)H-NMR: \(\delta = 7.93\) (s, 1H), 7.87 (d, \(J = 8.0\) Hz, 2H), 7.63–7.60 (m, 1H), 7.52–7.48 (m, 2H), 7.43 (d, \(J = 8.0\) Hz, 2H), 7.19 (d, \(J = 8.0\) Hz, 2H), 4.50 (s, 2H), 3.56 (s, 3H), 2.38 (s, 3H) ppm; \(^{13}\)C-NMR: \(\delta = 166.0, 145.6, 139.3, 138.5, 132.7, 129.8, 128.5, 128.0, 127.6, 118.7, 54.3, 51.3, 20.4\) ppm; ESI-HRMS: calcd. For C\(_{18}\)H\(_{18}\)O\(_4\)S+Na 353.0823, found 353.0820.

(Z)-Methyl 2-[(phenylsulfonyl)methyl]-3-(thiophen-2-yl)acrylate (3l). Light brown liquid; 96% yield; Z/E = 82:18; \(^1\)H-NMR: \(\delta = 7.86–7.81\) (m, 2H), 7.64–7.61 (m, 1H), 7.54–7.51 (m, 2H), 7.12 (t, \(J = 8.0\) Hz, 1H), 4.24 (s, 2H), 3.48 (s, 3H), 2.20–2.14 (m, 2H), 1.49–1.40 (m, 2H), 0.91 (t, \(J = 8.0\) Hz, 3H) ppm; \(^{13}\)C-NMR:
δ = 166.2, 151.9, 139.0, 129.2, 128.9, 120.8, 54.2, 52.1, 31.6, 21.7, 14.0 ppm; ESI-HRMS: calcd. For C_{14}H_{18}O_{4}S+Na 305.0823, found 305.0829.

(3n). Colourless liquid; 99% yield; Z/E < 1:99; 1H-NMR: δ = 7.94–7.92 (m, 2H), 7.74–7.68 (m, 3H), 7.63–7.59 (m, 2H), 7.47–7.41 (m, 3H), 7.09 (s, 1H), 4.05 (s, 2H) ppm; 13C-NMR: δ = 151.9, 137.6, 134.7, 132.5, 131.7, 129.6, 129.3, 129.1, 128.8, 117.1, 98.0, 61.4 ppm; ESI-HRMS: calcd. For C_{16}H_{13}NO_{2}S+Na 306.0565, found 306.0566.

(3o). Colourless liquid; 95% yield; Z/E = 84:16; 1H-NMR: δ = 7.93 (s, 1H), 7.71 (d, J = 8.0 Hz, 2H), 7.47 (m, 2H), 7.37 (m, 3H), 7.27 (d, J = 8.0 Hz, 2H), 4.48 (s, 2H), 3.62 (s, 3H), 2.42 (s, 3H) ppm; 13C-NMR: δ = 167.1, 146.3, 144.8, 136.3, 133.8, 129.7, 129.3, 128.8, 128.6, 121.2, 55.2, 52.5, 21.7 ppm; ESI-HRMS: calcd. For C_{18}H_{18}O_{4}S+Na 353.0823, found 353.0827.

4. Conclusions

In summary, we have established a method for the allylic sulfonylation of MBH carbonates with sodium sulfinates under catalyst-free reaction conditions. A series of functionalized trisubstituted allylic sulfones were rapidly generated in good to excellent yields (71%–99%) with good to high selectivity (Z/E from 79:21 to >99:1). Compared with known synthetic methods, the current protocol features mild reaction temperature (40 °C), high efficiency (full conversion within 2 h) and easily available reagents. Thus, it should provide an efficient and facile access to the trisubstituted allylic sulfones. Further studies on expanding the substrate scope and chemical transformations of the trisubstituted allylic sulfones are currently underway.
