# Supplementary Materials: Computational Evaluation of Nucleotide Insertion Opposite Expanded and Widened DNA by the Translesion Synthesis Polymerase Dpo4

Laura Albrecht, Katie A. Wilson and Stacey D. Wetmore

**Figure S1.** Overlay of representative MD structures for the Dpo4 ternary complex for the replication of (**a**) modified pyrimidines and dT (white) or (**b**) modified purines and dG (black), highlighting the interaction with Tyr12.

Molecules 2016, 21, 822; doi:10.3390/molecules21070822

**Figure S2.** Overlay of representative MD structures for the Dpo4 ternary complex for the replication of (**a**) modified purines and dG (black) or (**b**) modified pyrimidines and dT (white), highlighting the interactions with the dNTP. Only the interacting portion (side or main chain) of the amino acid residue is shown, with an \* indicating that only the backbone is shown for that residue.

**Figure S3.** Snapshots taken from the simulation trajectory to show examples of base-pair distortions for the DNA helix containing dyA:dTTP in the Dpo4 ternary complex.

**Figure S4.** Snapshots taken from the simulation trajectory to show examples of base-pair distortions for the DNA helix containing dyC:dGTP in the Dpo4 ternary complex.

**Figure S5.** Average and standard deviations of base-pair parameters for the DNA, xDNA or yDNA helix in the Dpo4 ternary complex. See Figure S11 for numbering of the base pairs.

**Figure S6.** Average and standard deviations of base-step parameters for the DNA, xDNA or yDNA helix in the Dpo4 ternary complex. In the base-step numbering, the first step includes the dN:dNTP and n - 1 base pairs, the second step includes the n - 1 and n - 2 base pairs, and so on. See Figure S11 for numbering of the base pairs.

S5 of S25

**Figure S7.** Overlay of representative MD structures for the Dpo4 ternary complex for the replication of (**a**) modified purines and dG (black) or (**b**) modified pyrimidines and dT (white), highlighting the structure of the dN:dNTP and n - 1 base pairs.

S6 of S25

**Figure S8.** Overlay of representative MD structures for the Dpo4 ternary complex for the replication of (a) modified purines and dG (black) or (b) modified pyrimidines and dT (white), highlighting the interactions with the d(x,y)N backbone.

S7 of S25

**Figure S9.** Overlay of representative MD structures for the Dpo4 ternary complex for the replication of (**a**) modified purines and dG (black) or (**b**) modified pyrimidines and dT (white), highlighting the structure of the dN:dNTP base pair and ceiling region.

S8 of S25

**Figure S10.** Overlay of representative MD structures for the Dpo4 ternary complex for the replication of (**a**) modified purines and dG (black) or (**b**) modified pyrimidines and dT (white), highlighting the overall structure of Dpo4. See Figure 2 for labeling of the domains.

**Table S1.** Average MM/GBSA binding energy (kcal mol<sup>-1</sup>) between individual residues and the dNTP or dN over 40 ns MD simulations of the Dpo4 ternary complex for the replication of a DNA, xDNA or yDNA base. <sup>a,b</sup>

<sup>a</sup> All interactions listed have a contribution of >5 kcal mol<sup>-1</sup> in one or more of the simulations. <sup>b</sup> Interaction energy is for the DNA (including dNTP) ligand binding to the Dpo4 receptor.

**Table S2.** Percent occupancy, average distance and average angle for hydrogen-bonding interactions that stabilize the dNTP during 40 ns MD simulations of the Dpo4 ternary complex for the replication of a DNA, xDNA or yDNA base.<sup>a</sup>

**Table S8.** Percent occupancy, average distance and average angle of the hydrogen-bonding interactions occurring between the template strand (dN or the n+1 dC) and the little finger domain during 40 ns MD simulations of the Dpo4 ternary complex for the replication of a DNA, xDNA or yDNA base. <sup>a</sup>

<sup>a</sup> Hydrogen-bonding occupancies are based on a distance cutoff of <3.4 Å, an angle cutoff of >120° and a MM/GBSA energy cutoff of 5 kcal mol<sup>-1</sup>. See Figure S11 for numbering of the DNA helix. <sup>b</sup> Not observed with >5% occupancy, with an average angle >149° and a distance of <3.4 Å.

Table S9. Backbone RMSD for the domain over 40 ns MD simulations of the Dpo4 ternary complex for the replication of a DNA, xDNA or yDNA base. a.b.

<sup>a</sup> Simulation C $\alpha$  RMSD relative to the representative structure for the simulation. Initial alignment is based on the entire enzyme. <sup>b</sup> Domain residues are: palm domain (residues 1–10 and 78–166), finger domain (residues 11–77), thumb domain (residues 167–233), little finger domain (residues 244–341), tether (residues 234–343), and finger loop (residues 41–46).

**Table S10.** Backbone RMSD for each domain over 40 ns MD simulations of the Dpo4 ternary complex for the replication of an xDNA or yDNA base relative to the replication of natural DNA.<sup>a,b</sup>

<sup>a</sup> Hydrogen-bonding occupancies are based on a distance cutoff of <3.4 Å, an angle cutoff of >120° and a MM/GBSA energy cutoff of 5 kcal mol<sup>-1</sup>. See Figure S11 for the numbering of DNA helix. <sup>b</sup> Not observed with >5% occupancy, an average angle >149° and a hydrogen-bond distance of <3.4 Å.

**Table S12.** Percent occupancy, average distance and average angle of the hydrogen-bonding interactions occurring between the primer strand and the little finger domain during 40 ns MD simulations of the Dpo4 ternary complex for the replication of a DNA, xDNA or yDNA base.<sup>a</sup>

<sup>a</sup> Hydrogen-bonding occupancies are based on a distance cutoff of <3.4 Å, an angle cutoff of >120° and a MM/GBSA energy cutoff of 5 kcal mol<sup>-1</sup>. See Figure S11 for the numbering of DNA helix. <sup>b</sup> Not observed with >5% occupancy, with an average angle <149° and a hydrogen–bond distance of <3.4 Å.

**Table S13.** Percent occupancy, average distance and average angle of the hydrogen-bonding interactions between the template strand and the tether domain during 40 ns MD simulations of the Dpo4 ternary complex for the replication of a DNA, xDNA or yDNA base. <sup>a</sup>

<sup>a</sup> Interaction energies represent the DNA (including dNTP) ligand binding to the Dpo4 receptor. See Figure S11 for numbering of DNA helix. <sup>b</sup> Energies for the (x,y)-purines are relative to the dG:dCTP simulation, while energies for the (x,y)-pyrimidines are relative to the dT:dATP simulation. <sup>c</sup> Little finger domain includes residues 244-341. <sup>d</sup> Tether domain includes residues 234-243. <sup>e</sup> Sum of the energy changes listed for each domain.

**Table S24.** RMSD over 40 ns MD simulations of the Dpo4 ternary complex for the replication of a DNA, xDNA or yDNA base. <sup>a</sup>

| Active Site Base Pair | RMSD          |
|-----------------------|---------------|
| dG:dCTP               | $1.3 \pm 0.2$ |
| dT:dATP               | $1.5 \pm 0.3$ |
| dxA:dTTP              | $1.3 \pm 0.2$ |
| dyA:dTTP              | $1.3 \pm 0.2$ |
| dxG:dCTP              | $1.2 \pm 0.2$ |
| dyG:dCTP              | $1.4 \pm 0.2$ |
| dxT:dATP              | $1.2 \pm 0.2$ |
| dyT:dATP              | $1.1 \pm 0.1$ |
| dxC:dGTP              | $1.2 \pm 0.2$ |
| dyC:dGTP              | $1.6 \pm 0.2$ |

<sup>a</sup> RMSD is relative to the first frame in the respective simulation.
