2 Spectral details for OH coupling constants

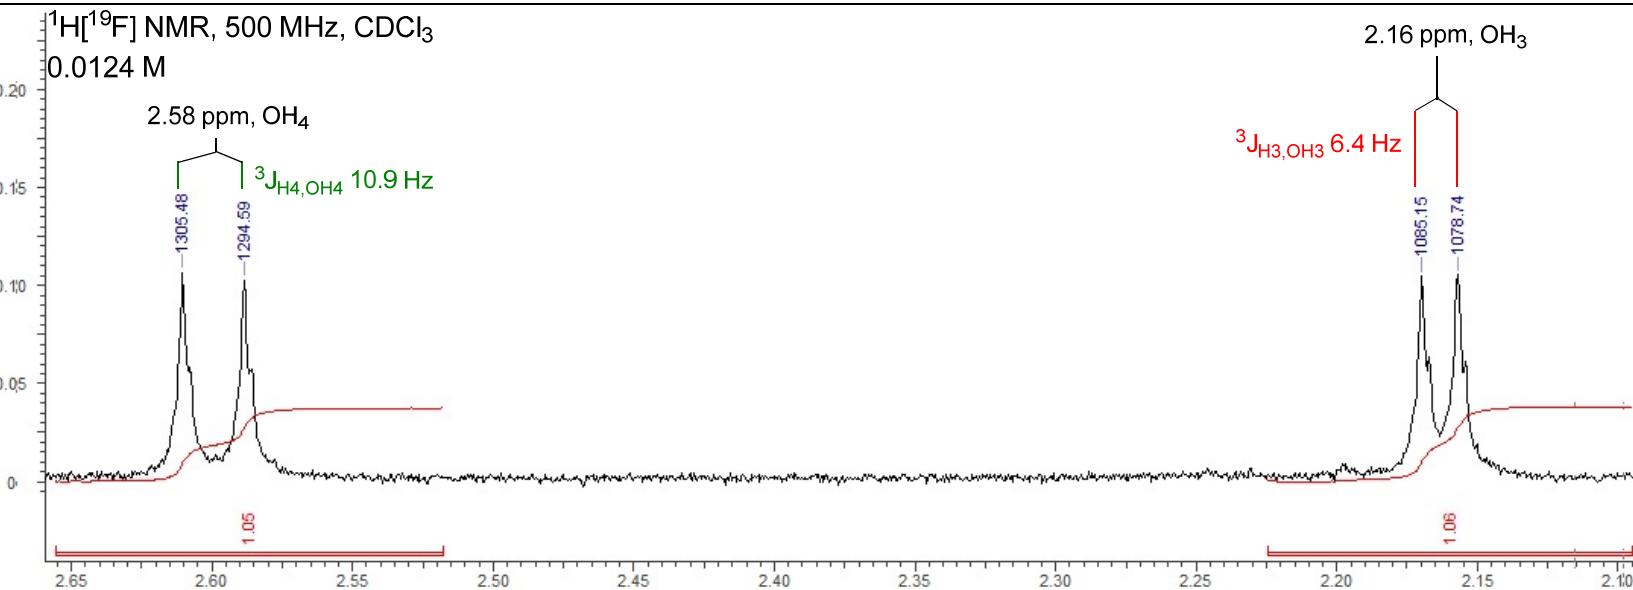

2.1 Sample preparation

Samples were prepared as follows : dried molecular sieves (3\AA) were added (0.3 v/v) to the solution of the levoglucosan derivative in CDCl_3 in a 4 mL vial. The solution was stirred overnight at room temperature. The sieves were allowed to settle and the supernatant was transferred to a dried (oven + vacuum) NMR tube. The vial was kept under argon, and the transfer was carried out with a dried syringe flushed with argon.
