

Figure S2. Suramin fails to induce histone H4 or α -tubulin acetylation in K-562 cells. K-562 cells were treated with DMSO (D), 5 or 50 μ M eurochevalierine and SAHA (S; 1 μ M). Acetylation of histone H4 (AcH4) and α -tubulin (Ac α -tubulin) was analyzed by Western Blot. β -actin and histone H1 were used as loading controls for the analysis of total and acid extracts, respectively. Blots are representative of three independent experiments.
