Section 1: Crystallographic data for 1.

Section 2: The related equations.

Section 3: Thermogravimetric analyses of 1, Fe₃O₄@1 and Fe₃O₄.

Section 4: Adsorption activity comparison of 1, Fe₃O₄@1 and Fe₃O₄.

Section 1: Crystallographic data for 1

	1
Formula	C ₂₈ H ₄₂ Mo ₅ N ₂₀ Ni ₂ O ₂₅ P ₂ S ₄
F _w	1846.05
Crystal system	Monoclinic
space group	C2/c
a/[Å]	30.575(7)
b/[Å]	13.276(3)
c/[Å]	17.009(4)
β[°]	113.837(5)
Z	4
Volume/[Å ³]	6315(3)
Calculated bulk density/[g cm ⁻³]	1.940
Absorption coefficient/[mm ⁻¹]	1.814
F(000)	3632
Limiting index	-20 ≤ h ≤ 36, -15 ≤ k ≤ 15, -20 ≤ l ≤ 19
Theta range of data collection	1.70 to 25.00°
Limiting index	-20 ≤ h ≤ 36, -15 ≤ k ≤ 15, -20 ≤ l ≤ 19
Reflections collected/unique	15775/5569 [R(int) = 0.0686]
Data/restraints/parameters	5569/0/385
Goodness-of-fit on F ²	1.054
Final R indices [I > 2σ(I)]	R ₁ = 0.1755, wR ₂ = 0.3979
R indices (all data)	R ₁ = 0.2297, wR ₂ = 0.4257
Largest diff. peak and hole/[e · Å ⁻³]	4.763, -4.493

Section 2. The related equations.

$$\text{Removal efficiency (\%)} = \frac{A_0 - A_t}{A_0} \quad (1)$$

$$q_e = \frac{(C_0 - C_e) \times V}{w} \quad (2)$$

where C_0 and C_t are the dyes concentration (mg/L) at initiation and the time t . A_0 and A_t are the dye absorbance at initiation and the time t . w and V is the dosage of the adsorbent (mg) and the amount of dye (mL), respectively.

$$\log(q_e - q_t) = \log q_e - k_1 t \quad (3)$$

$$\frac{t}{q_t} = \frac{1}{k_2(q_e)^2} + \frac{t}{q_e} \quad (4)$$

where q_t is the adsorption capacity of MB at time t . k_1 is the rate constant of pseudo-first-order, k_2 is the rate constant of pseudo-second-order.

$$\frac{C_e}{q_e} = \frac{C_e}{q_m} + \frac{1}{K_L q_m} \quad (5)$$

$$\lg q_e = \lg K_f + \left(\frac{1}{n}\right) \lg C_e \quad (6)$$

where q_m and C_e are the maximum adsorption capacity and equilibrium concentration of MB in the solution, respectively. K_L is the Langmuir constant. K_F is the Freundlich constant. n is the adsorption strength.

Section 3: Thermogravimetric analyses of **1**, Fe₃O₄@**1** and Fe₃O₄.

Thermogravimetric analyses of **1**, Fe₃O₄@**1** and Fe₃O₄ were performed under a nitrogen flow (Figure. S1). It turns out that the weight ratio of **1** in Fe₃O₄@**1** is 89.57%. It should be noted that the loss of Fe₃O₄ might be attributed to its surfactant attached during the synthesis process.

Figure S1. Thermogravimetric analyses of **1**, Fe₃O₄@**1** and Fe₃O₄.

Section 4: Adsorption activity comparison of **1**, Fe₃O₄@**1** and Fe₃O₄.

Figure S2. Adsorption activity comparison of **1**, Fe₃O₄@**1** and Fe₃O₄. (MB: 15 mg/L, 10 mL; room temperature)
