

## Supporting Information

### Modeling adsorption and optical properties for the design of CO<sub>2</sub> photocatalytic Metal-Organic Framework

Priscila Chacón <sup>1</sup>, Joseelyne G. Hernández-Lima <sup>2</sup> Adán Bazán-Jiménez <sup>3</sup> and Marco A. García-Revilla\*

Chemistry Department, Natural and Exact Sciences Division, University of Guanajuato, Noria Alta S/N, 36050-Guanajuato, Mexico.; p.chaconmartinez@ugto.mx (P.C); joseelyne.hernandez@ugto.mx (J.G.H-L); jabazan@ugto.mx (A.B-J); magarcia@ugto.mx (M.A.G-R)

\* In bond column X represents guest atom and Y structure atom. \*\* Both atoms belong to the guest(s) molecule(s) indicated.

**Figure SI-1.** Optimized geometries for the calculation of the brightest excited states of the primitive cell (IRMOF-C-BF<sub>2</sub>) and the linker (C-BF<sub>2</sub>) in the presence of H<sub>2</sub> and CO<sub>2</sub>. The distances specified are shown in Angstroms (Å). Notice the small distances between the atoms of the guests and boron of BF<sub>2</sub> substituents and the O atom of the carbonyl moiety. The association of one oxygen of CO<sub>2</sub> to the boron can be explained with an acid-base chemistry according to Lewis, in which the former behaves as a base and the later as an acid. A similar explanation can be given for H<sub>2</sub> association with the carbonyl group. In this way, the frustrated Lewis pair can be of assistance to the absorption of the guest molecules.

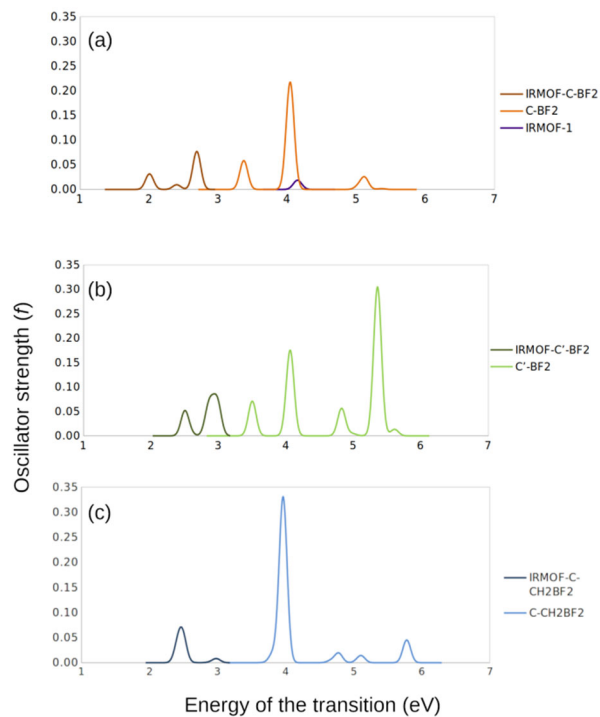

**Figure SI-2.** Molecular electrostatic properties of C-BF<sub>2</sub> linker and IRMOF-C-BF<sub>2</sub>:

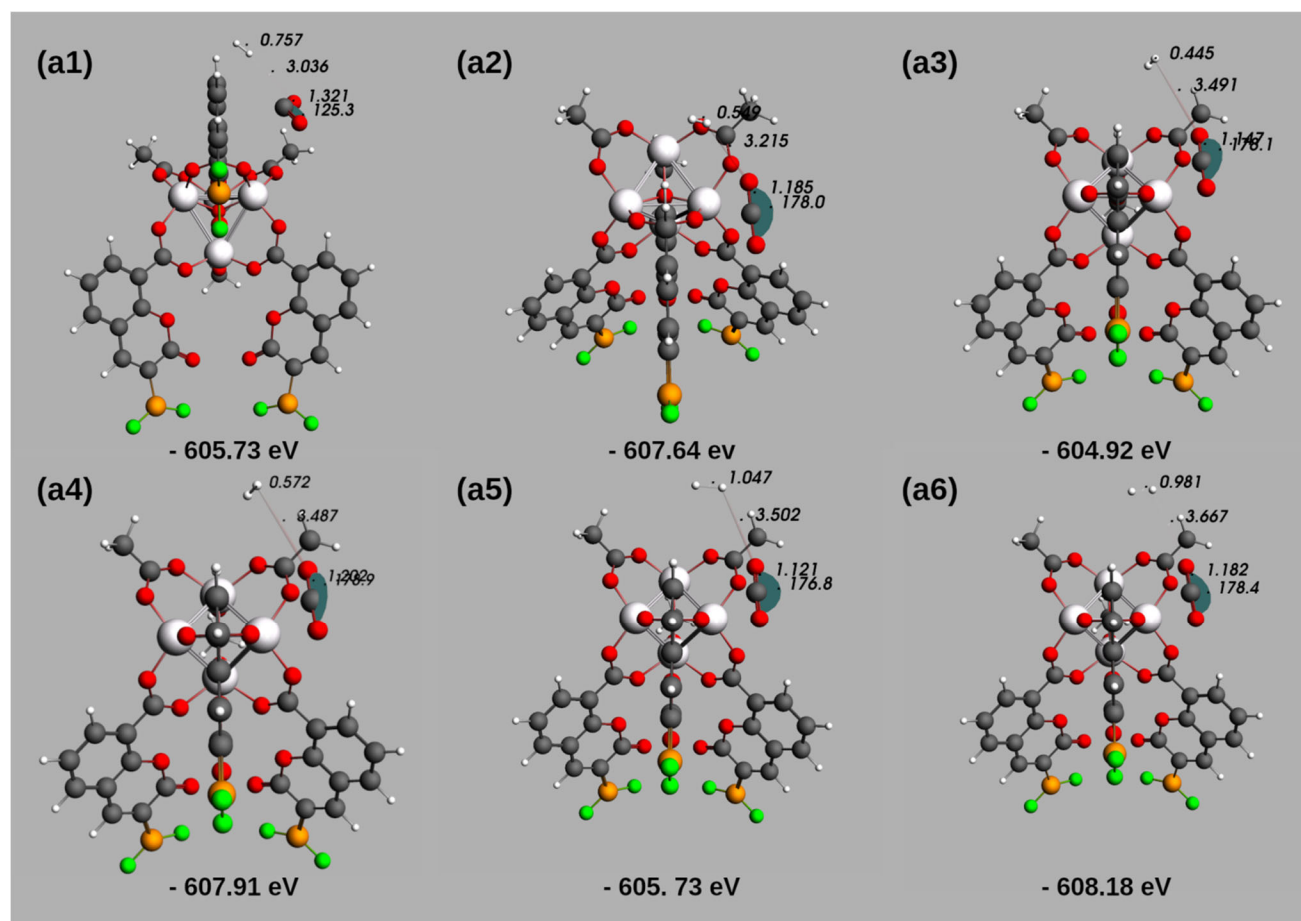

Isosurfaces of density and potential of the Self Consistent Field for C-BF<sub>2</sub> (a1, a2) and IRMOF-C-BF<sub>2</sub> (b1, b2) in the presence of H<sub>2</sub> and CO<sub>2</sub> as guest molecules. The considered value for those isosurfaces is settled 0.003. The most electron-deficient places are the boron atoms (a1, b1) for both the linker and MOF. The most electron-rich region in absence of the metallic cluster is the carbonyl oxygen (a1). Nevertheless, the most electron-rich region is not the same in the case of IRMOF-C-BF<sub>2</sub> (b1); here the oxygen atoms of the OCO bridges display this characteristic. For this reason, we can assume that CO<sub>2</sub> oxygen atoms would adsorb near the boron atoms. Although this is observed for C-BF<sub>2</sub>, it is otherwise for the IRMOF-C-BF<sub>2</sub>, see Figure SI-1. In the latter, the absorption of the electron-deficient carbon of CO<sub>2</sub> near the most electron-rich moiety of IRMOF-C-BF<sub>2</sub> becomes more relevant than the adsorption directed by oxygen atoms of CO<sub>2</sub> to the boron atoms of ligand. Comparing (a1) and (a2) Molecular Electrostatic Potentials (MEPs), there is no change in the electron density neither in C-BF<sub>2</sub> nor in the guests during adsorption. Considering that the distance among the guests and IRMOF-C-BF<sub>2</sub> is larger than for C-BF<sub>2</sub>, it is reasonable that the MEPs do not show important changes from IRMOF-C-BF<sub>2</sub> isolated (b1) compared with the configuration in which the absorption has taken place (b2).

**Figure SI-3.** Frontier Orbitals of C-BF<sub>2</sub> and IRMOF-C-BF<sub>2</sub>. Geometry of the Highest Occupied Molecular Orbital (HOMO) and Lowest Unoccupied Molecular Orbital (LUMO) of C-BF<sub>2</sub> and IRMOF-C-BF<sub>2</sub>, before and after the absorption of H<sub>2</sub> and CO<sub>2</sub> as guest molecules. The images that include guest molecules are indicated with an apostrophe (') after the letter used to distinguish between C-BF<sub>2</sub> (a) and IRMOF-C-BF<sub>2</sub> (b). Regarding C-BF<sub>2</sub>, both frontier orbitals keep their geometry and location over the linker's structure comparing the isolated linker (a) and the structure of the adsorbed guests in the linker (a'). The HOMO has a bonding character mostly on the coumarin-based-rings (eight lobes above and below the plane of symmetry of the molecule, six of them above and below the rings and two on the oxygen atom of the carbonyl moiety), whereas the LUMO shows an antibonding character (fourteen lobes, above and below the plane of symmetry of the molecule). In addition, the apparent bonding character across the bond-path (see QTAIM results) that links the boron atom and the carbon of the carbonyl group in the LUMO support the region near the boron atom as the most prone to interact with the guests' HOMO. For the case of IRMOF-C-BF<sub>2</sub> (b and b'), HOMO and LUMO are located on the linkers, excluding the MOF's central cluster as the probable absorption moiety. Such situation corresponds to the observed profile of the MEP: the electron density available for absorption is not in the metallic cluster of the MOF. The HOMO shows mainly antibonding character (sixteen lobes); it is distributed over two linkers, it has a symmetry plane that includes the coordinate axis that goes through the coumarin moiety whose atoms do not contribute to the orbital, this results in a symmetrical shape of the lobes in both linkers involved. The LUMO has antibonding character, with its highest probability zones above and below the plane of one of the linkers, a similar distribution to the observed for C-BF<sub>2</sub>; in a similar fashion as C-BF<sub>2</sub>, the orbital's morphology is kept when the guest are absorbed (b').

**Figure SI-4.** Calculated UV and Visible spectra of MOF and its parent linkers in the presence of H<sub>2</sub> and CO<sub>2</sub> as guest molecules. (a) IRMOF-C-BF<sub>2</sub>, C-BF<sub>2</sub> and IRMOF-1; (b) IRMOF-C'-BF<sub>2</sub> and C'-BF<sub>2</sub>; (c) IRMOF-C-CH<sub>2</sub>BF<sub>2</sub> and C-CH<sub>2</sub>BF<sub>2</sub>. The oscillator strength is plotted as a function of the transition's energy (eV). The  $f$  value of IRMOF-C-BF<sub>2</sub> and IRMOF-1 is multiplied by a factor of 10.

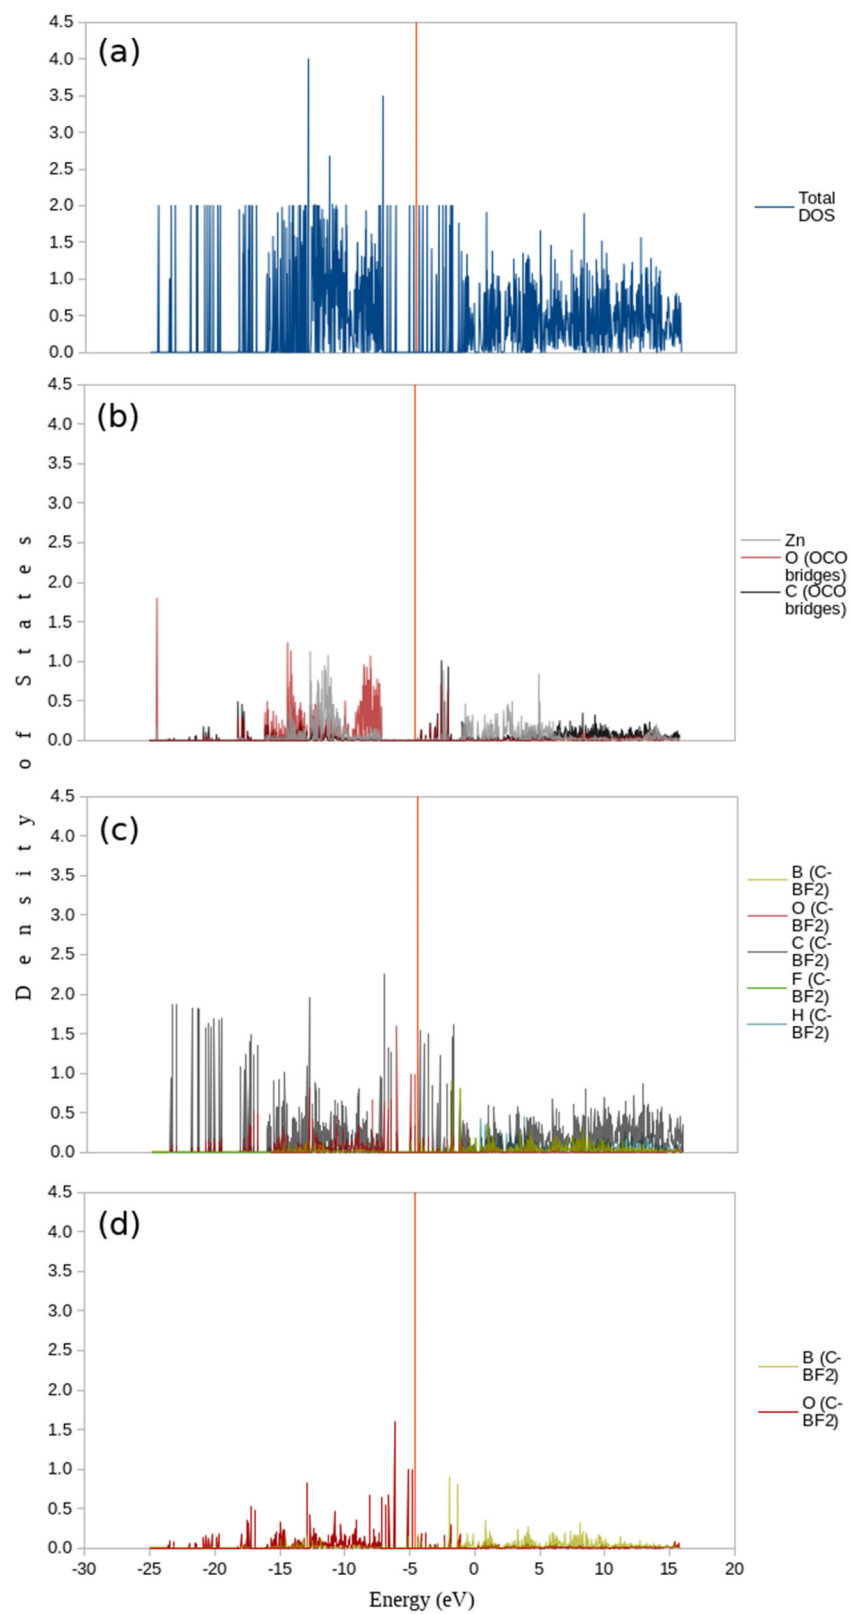

**Figure SI-5.** Energetic maximums obtained during excited states optimizations for IRMOF-C-BF<sub>2</sub>-H<sub>2</sub>-CO<sub>2</sub>. The energies and the most significant distances and bond angles of all geometries are included. As a comparison, the energy of the minimum is – 608.807 eV. The first maximum (a1) shows appreciable distortion to the OCO angle in CO<sub>2</sub> (30.39% of distortion, 125.3°) and elongation of the OC distance in 13.15% (1.321 Å); H<sub>2</sub> is placed 3.036 Å away from CO<sub>2</sub> with no appreciable HH length distortion. The next two energetic maximums (a2, a3) present just slight elongation in one of the OC distances of CO<sub>2</sub> (lower than 2.5% of the equilibrium distance for isolated CO<sub>2</sub>); HH distance is decreased in both cases (to 0.549 Å or 26.90% of decrease for a2, and 0.455 Å or 39.41% of decrease for a3); however, the distance among the guest molecules increases in some extent (to 3.215 Å for a2, and to 3.491 Å for a3). In the named (a4) maximum, compression of HH bond length (to 0.572 Å or 23.83 % of decrease) and elongation of OC distance in CO<sub>2</sub> (to 1.202 Å or 2.38% of decrease) can be perceived; the distance among both guests is 3.487 Å. In the fifth maximum (a5), the guest molecules are 3.502 Å apart; HH and OC bond lengths are elongated (to 1.047 Å or 39.41 % of elongation, and to 1.121 Å or 4.51% of elongation, respectively). The last energetic maximum (a6) is just slightly different from the previous: the guest molecules are 3.667 Å apart; and HH bond length is elongated (to 0.981 Å or 30.63 % of elongation). The energetic differences among all maximums are lower than 2.72 eV.

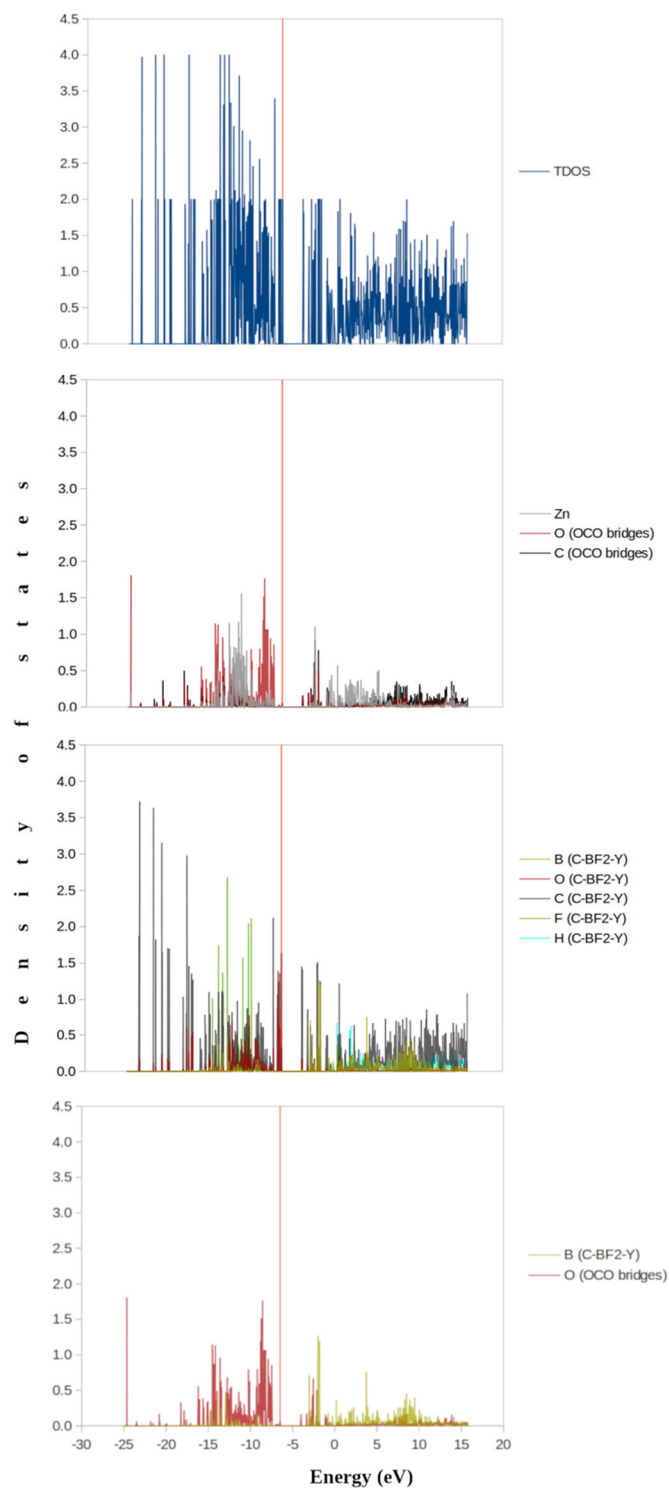

**Figure SI-6.** Energetic maximums obtained during excited states optimizations for IRMOF-C-BF<sub>2</sub>-CO<sub>2</sub>-H<sub>2</sub>O. The energies and the most significant distances and bond angles of all geometries are included. As a comparison, the energy of the minimum is - 616.263 eV. IRMOF-C-BF<sub>2</sub> keeps guests absorbed while the distance among the guests falls in the range of 2.143 Å to 2.534 Å. OCO angle is distorted in the first two maximums (to 129.3° or 28.17% of distortion for b1, and 142.4° or 20.89% of distortion for b2), but kept almost unchanged in the next three. In the first maximum (b1), only one OC bond length is elongated (to 1.295 Å or 10.31% of elongation); HOH angle in water is slightly reduced (to 101.4° or in 2.97%) with no distortion of bond lengths. HOH angle in H<sub>2</sub>O opens in the next maximum (b2) (to 116.8° or 11.77% of distortion) with no appreciable modification to the equilibrium bond lengths for both guests. The third maximum (b3) shows a longer OC distance (1.258 Å, or 7.16% of elongation) than the equilibrium one for CO<sub>2</sub>; HOH angle in H<sub>2</sub>O is also distorted (108.0° or 3.35% of distortion). The last two maximums (b4 and b5) are characterized by a compressed HOH angle in the water guest (91.0° or 12.92% of compression for b4, and 90.8° or 13.11% of compression for b5); while both OH bond distances in water are kept constant, OC bond lengths are distorted for CO<sub>2</sub> (1.092 Å or 6.99% of distortion for b4, and 1.186 Å or 1.02% of distortion for b5). The energetic differences among all maximums are lower than 1.36 eV.

**Figure SI-7.** Density of States of IRMOF-C-BF<sub>2</sub>, as a function of energy (eV). The DOS are represented as (a) Total Density of States, TDOS, and Partial Density of States for the following fragments: (b) Central cluster, (c) C-BF<sub>2</sub> linker and (d) FLPs in linkers. The orange line present in all charts indicate the Fermi Level, with a value of – 4.63 eV.

**Figure SI-8.** Density of States of IRMOF-C'-BF<sub>2</sub>, as a function of energy (eV). The DOS are represented as (a) Total Density of States, TDOS, and Partial Density of States for the following fragments: (b) Central cluster, (c) C'-BF<sub>2</sub> linker and (d) FLPs formed between the O atoms of the OCO bridges and the -BF<sub>2</sub> groups on the linker to which they are attached. The orange line present in all charts indicate the Fermi Level, with a value of  $-4.63$  eV.
