Data description

This data is a detail report related to the VOC measurements described and analyzed in the paper **Weathering and safety of antibacterial polymer-resin polyfilaments**. The detailed description of the method, samples preparations and main outcomes are given in the manuscript. Tables 1-7 indicate the average and (range) concentration of emitted compounds from each polyfilament fibre sample analyzed at different temperatures.

Table 1. Average and (range) concentration of emitted compounds from fPE analyzed at different temperatures.

Data description

This data is a detail report related to the VOC measurements described and analyzed in the paper **Weathering of antibacterial melt-spun polyfilaments modified by pine rosin**. The detailed description of the method, samples preparations and main outcomes are given in the manuscript. Figures (1-7) are the direct graphs from the device software as ‘chromatograms’ (TIC, total ion chromatograms) for each polyfilament fibre sample analyzed at different temperatures. The graphs indicate the measured (computed) ion count (abundance, arbitrary units) as a function of time (minutes).

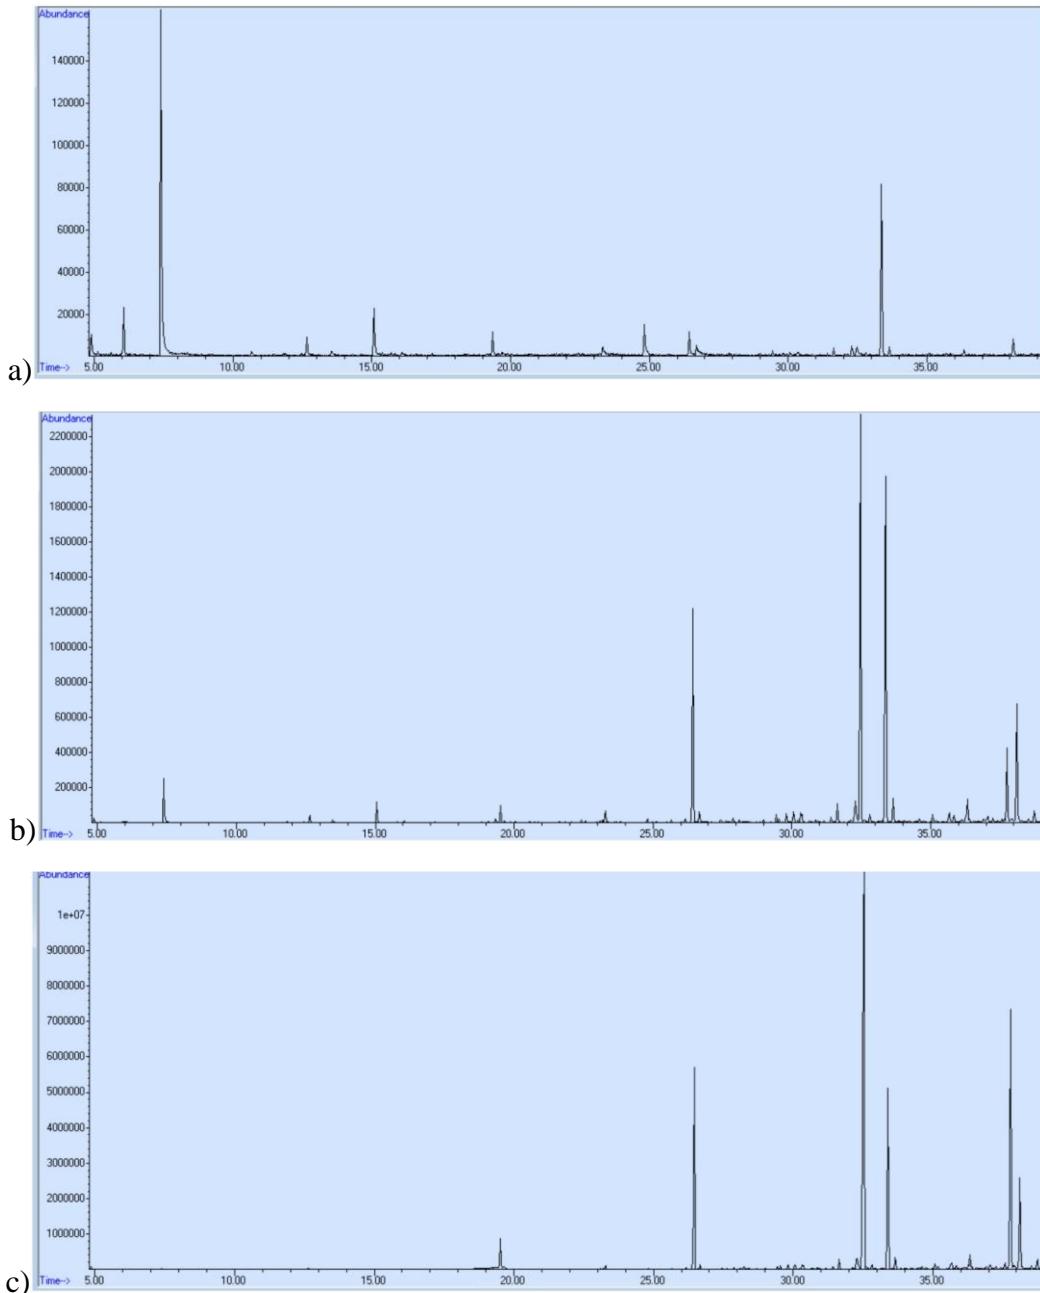

Figure 1. Measured emitted compounds from fPE analyzed at different temperatures: a) at 25 °C; b) at 60 °C; c) at 105 °C. Note the different range of vertical axis for different temperature cases.

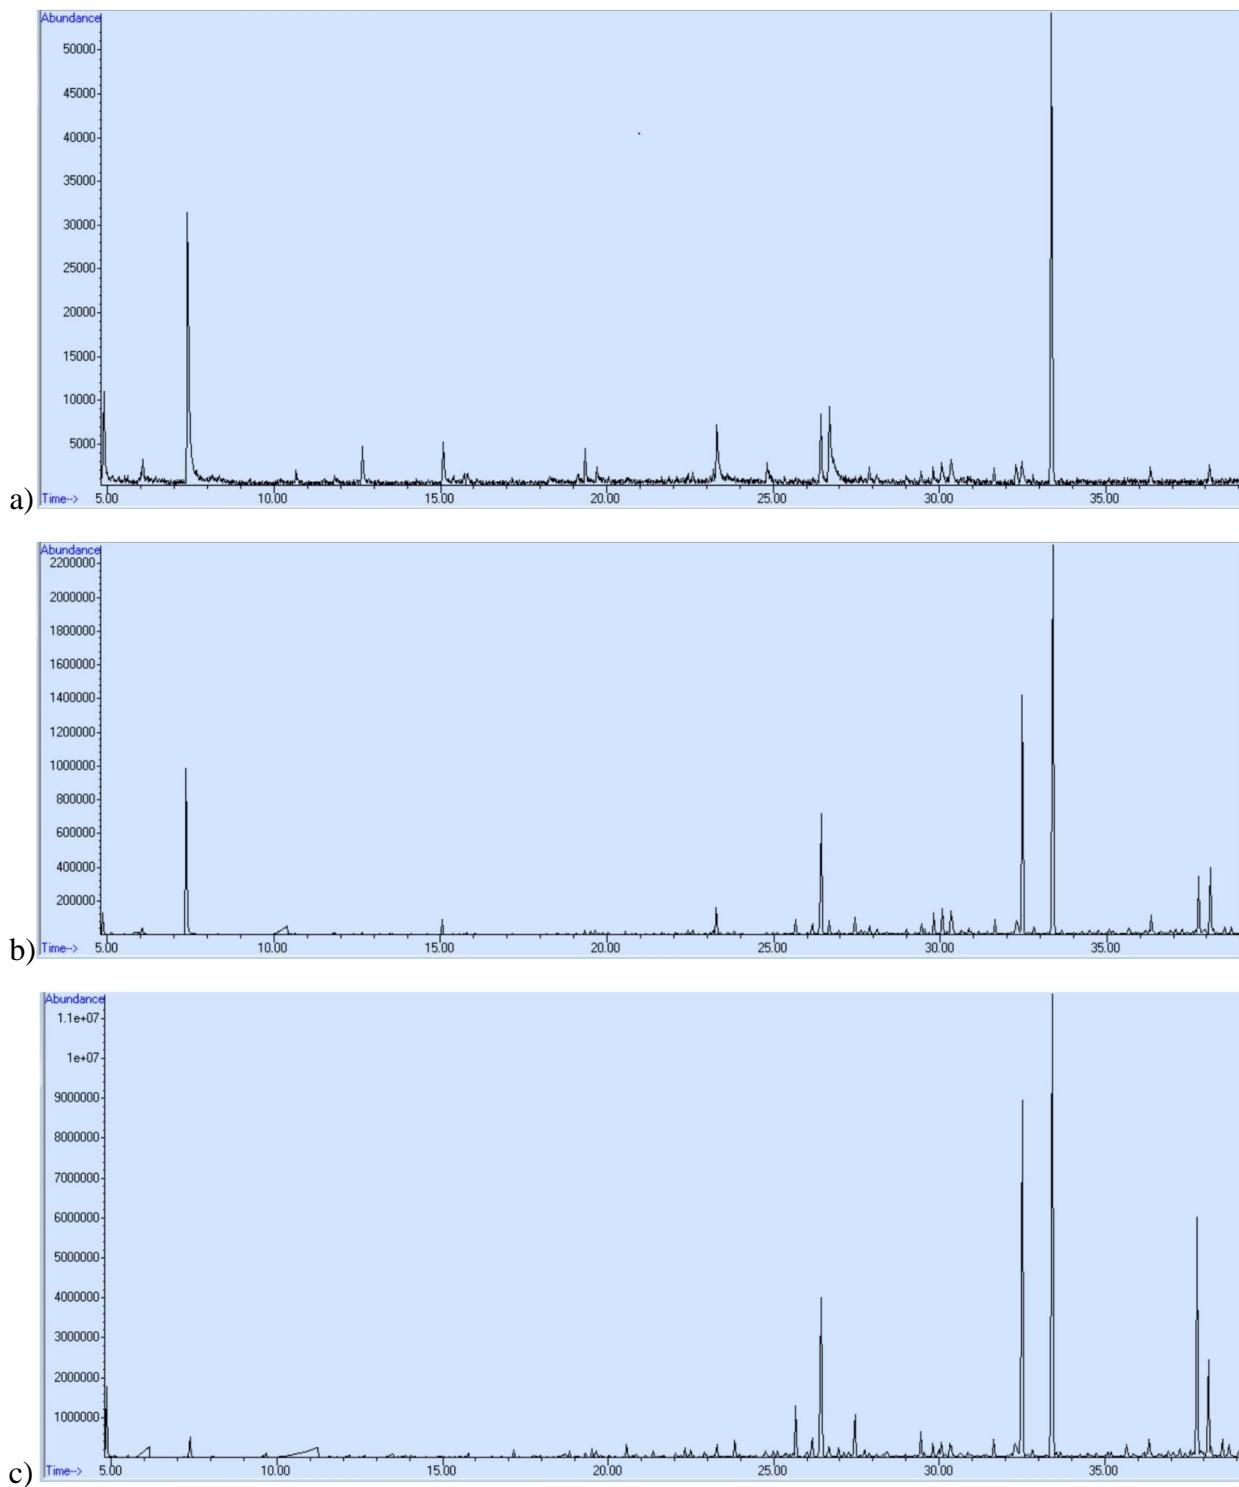

Figure 2. Measured emitted compounds from fPE10 analyzed at different temperatures: a) at 25 °C; b) at 60 °C; c) at 105 °C. Note the different range of vertical axis for different temperature cases.
