

Supplementary materials for

**The varietal influence of flavour precursors from grape marc on monoterpane and C<sub>13</sub>-norisoprenoid profiles in wine as determined by membrane-assisted solvent extraction (MASE) GC-MS**

Lisa Pisaniello, Flynn Watson, Tracey Siebert, Leigh Francis and Josh Hixson

Table S1: Red wine calibration and validation data for membrane-assisted solvent extraction (MASE) GC-MS method, as determined in duplicate in commercially available Shiraz (2018, 13.5% alcohol) or Pinot Noir (2017, 13.0% alcohol).

<sup>^</sup> Juice volume calculated from weight using an average juice density of 1.07 kg/L.

\* Determined using deuterated syringol gentiobioside as an internal standard, quoted in syringol gentiobioside equivalents.

<sup>#</sup> Analytical limits for geraniol glucoside: LOQ 5.0 µg/L; LOD, 1.00 µg/L determined in solution of extracts or juice. Equates to roughly 25 and 5 µg/g of extract, respectively.

<sup>†</sup> Analytical limits for disaccharides: LOQ 1.0 µg/L and LOD 0.3 µg/L in dissolved extracts (Equates to roughly 5 and 1 µg/g of extract); LOQ 5.0 µg/L and LOD 1.7 µg/L in juice.

<sup>‡</sup> Replacement value for < LOQ samples was the mean of the LOQ and LOD. For < LOD samples, the mean of the LOD and zero, in the matrix analysed in (juice or dissolved extract).

Table S5: Analysis of selected monoterpenes and C<sub>13</sub>-norisoprenoids by GC-MS after hydrolysis of marc extracts at pH 1 and 100 °C for one hour. Marc extracts were dissolved in water at approximately 400 mg/L (20 mg in 5 mL water) and hydrolysed in singlicate.

| Variety            | Type       | Linalool | Concentration after hydrolysis (µg/g of extract) |       |               |          |

\* Analysis failed and provided no data. <sup>a</sup> Replacement value determined as mean of LOQ and LOD. <sup>b</sup> Replacement value determined as mean of LOD and zero.

Table S9: Selected monoterpenes and C<sub>13</sub>-norisoprenoids in control Chardonnay wine and Chardonnay wine with 0.4 g/L additions of marc extract from different varieties after 6-months of storage at 15 °C. Data expressed as a proportion of the total volatile compounds analysed in the analytical suite.

| Sample              | Category   | Replicate | Proportion of total volatiles quantitated in analytical suite (%) |             |             |          |                |                  |             |               |       |          |                 |      |               |          |          |              |

\* Analysis failed and provided no data.

Table S10: Concentration of selected monoterpenes and norisoprenoids in Chardonnay wine with 0.4 g/L additions of either floral or non-floral marc extracts, analysed after six-months of storage at 15 °C. Data expressed as mean of all replicates ± standard deviation, with the ANOVA p-value and Tukey 95% honest significant difference (HSD) for each compound.

Compounds not shown - terpinolene, *trans*-rose oxide, 1,8-cineole only quantifiable in floral samples; TDN,  $\alpha$ -ionone, wine lactone not quantifiable in any samples

Table S11: Mean concentration of most abundant monoterpenes in replicate wines resulting from addition of extracts. Data expressed as concentration as analysed in the wines; concentration above that present in the control wines; volatile concentration expressed as a weight-to-weight of the added extract.

| Sample             | Extract spike (g/L) | Mean concentration in wine (µg/L)* |          |        |                     | Concentration in wine above control (µg/L) |          |        |                     | Concentration in wine (µg/g of extract) |          |        |                     |
