**Figures S1-S3.** B3LYP-D3/6-311++G(2d,p) potential energy profiles for the interconversion of conformers GA1-GA2 (S2), GA1-GA3, GA2-GA4 (S3), GA5a-GA5b (S4) of gallic acid.

**Figure S4-S6.** The CP-FTMW spectrum of laser ablated gallic acid in the 3-8 GHz region. In Figure S4 is compared to the fitted spectra, in Figure S5 to the DFT predicted spectra for conformers GA1-GA5, and in Figure S6 to the sum of DFT predicted spectra with intensities corrected using expected population ratios at room temperature.

**Figure S7.** Temperature dependence of the equilibrium relative population ratio  $N_{GA2}/N_{GA1}$  of conformers GA1 and GA2 calculated from the predicted B3LYP-D3/6-311++G(2d,p) vibrational and rotational data.

**Figure S7-S8** Results of the NCI analysis for the predicted GA3, GA4 and GA5 conformers of gallic acid.

**Figure S10.** Molecular graph showing the results of the QTAIM analysis of conformers GA3, GA4 and GA5 of gallic acid.

**Tables S1-S6.** Predicted Rotational parameters, electric dipole moment components, and energies for the five conformers of gallic acid, calculated at different levels of theory.

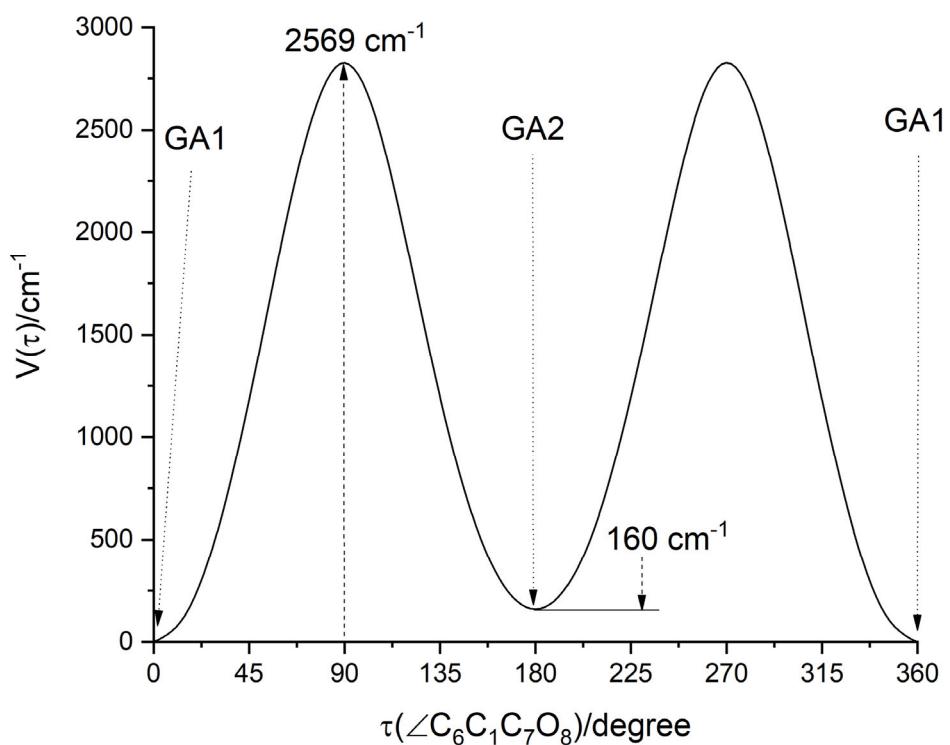

**Table S7-S11.**  $r_e$  geometry for the different conformers of gallic acid calculated at the B3LYP-D3/6-311++G(2d,p) for the five predicted conformers of gallic acid.

**Table S12-S13.** Observed rotational transitions and residuals (all the values in MHz) for the observed rotamers of gallic acid.

Gaussian, Inc., Wallingford CT, 2016.

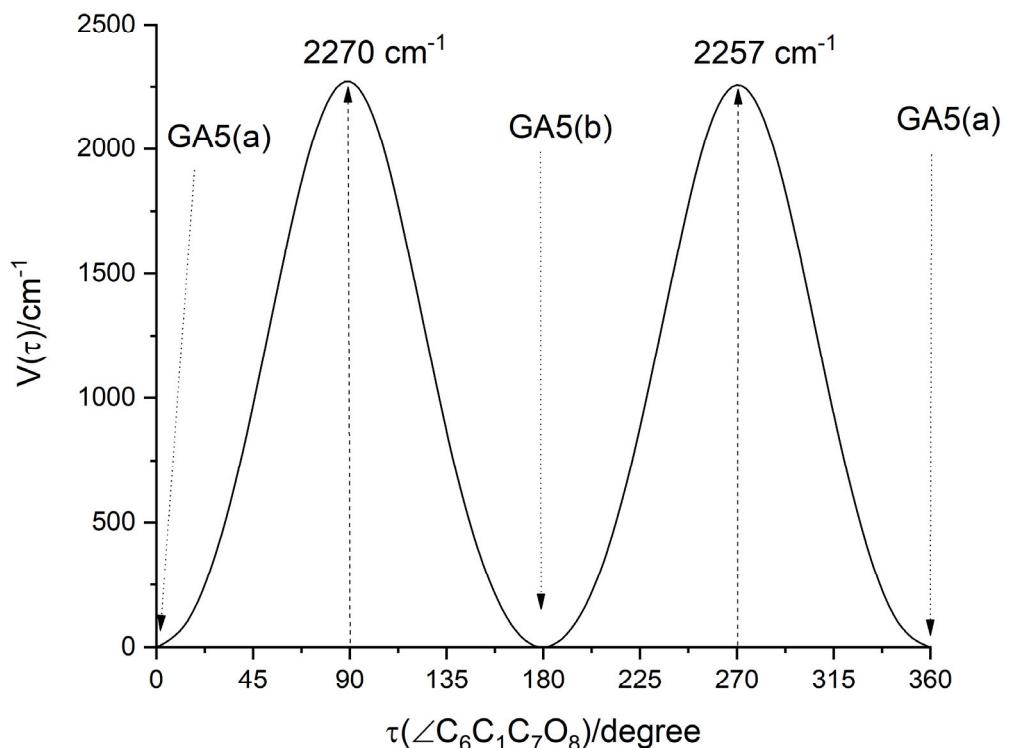

**Figure S1.** B3LYP-D3/6-311++G(2d,p) potential energy profile for the rotation of the COOH group of gallic acid interconverting conformers GA1-GA2 (see Figure 1). (1 kJ/mol = 83.5935 cm<sup>-1</sup>).

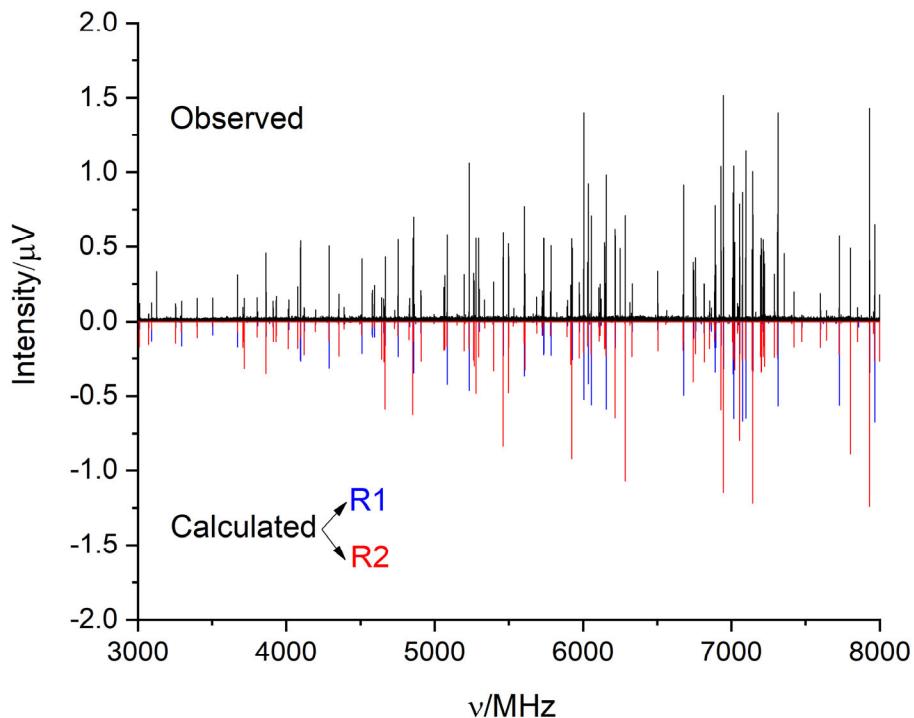

**Figure S2.** B3LYP-D3/6-311++G(2d,p) potential energy profile for the rotation of the O<sub>10</sub>H<sub>16</sub> group of gallic acid interconverting conformers GA1-GA3 as well as GA2-GA4 (see Figure 1). (1 kJ/mol = 83.5935 cm<sup>-1</sup>).

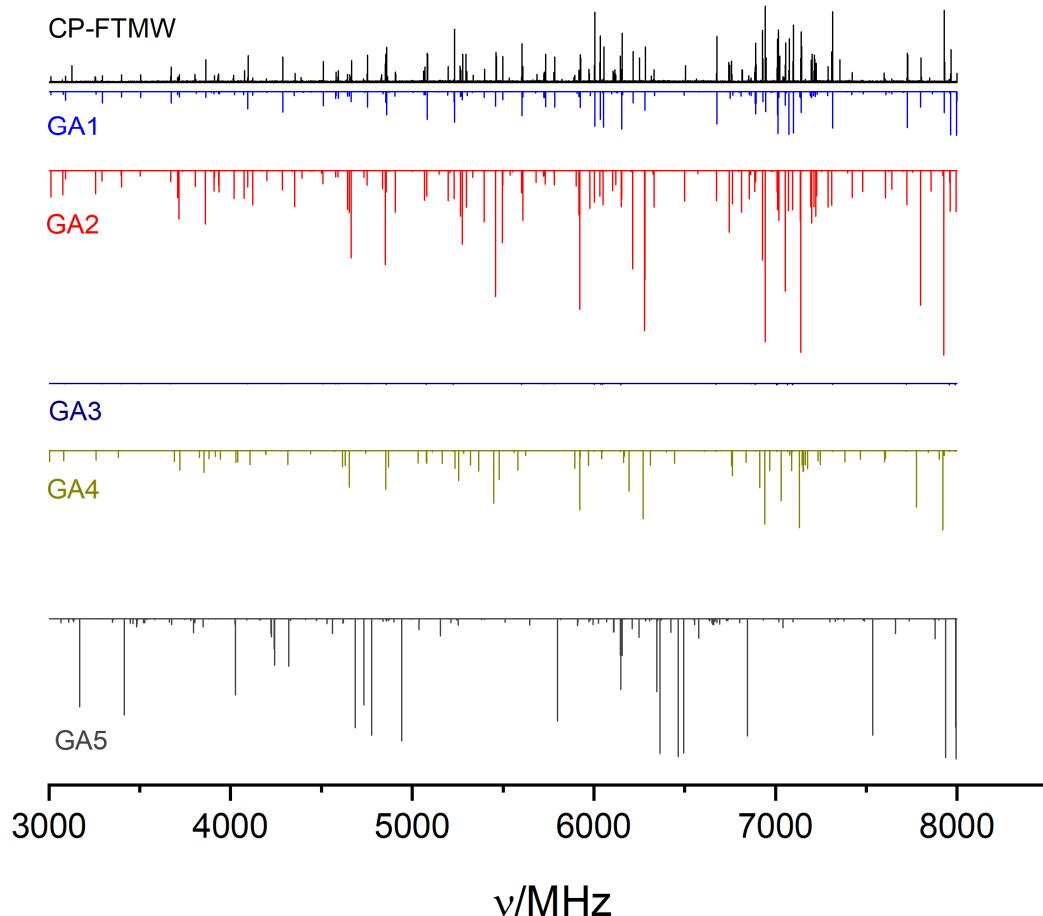

**Figure S3.** B3LYP-D3/6-311++G(2d,p) potential energy profile for the rotation of the COOH group of gallic acid conformers GA5 interconverting atropisomers (a) and (b) (see Figure 1). (1 kJ/mol = 83.5935 cm<sup>-1</sup>).

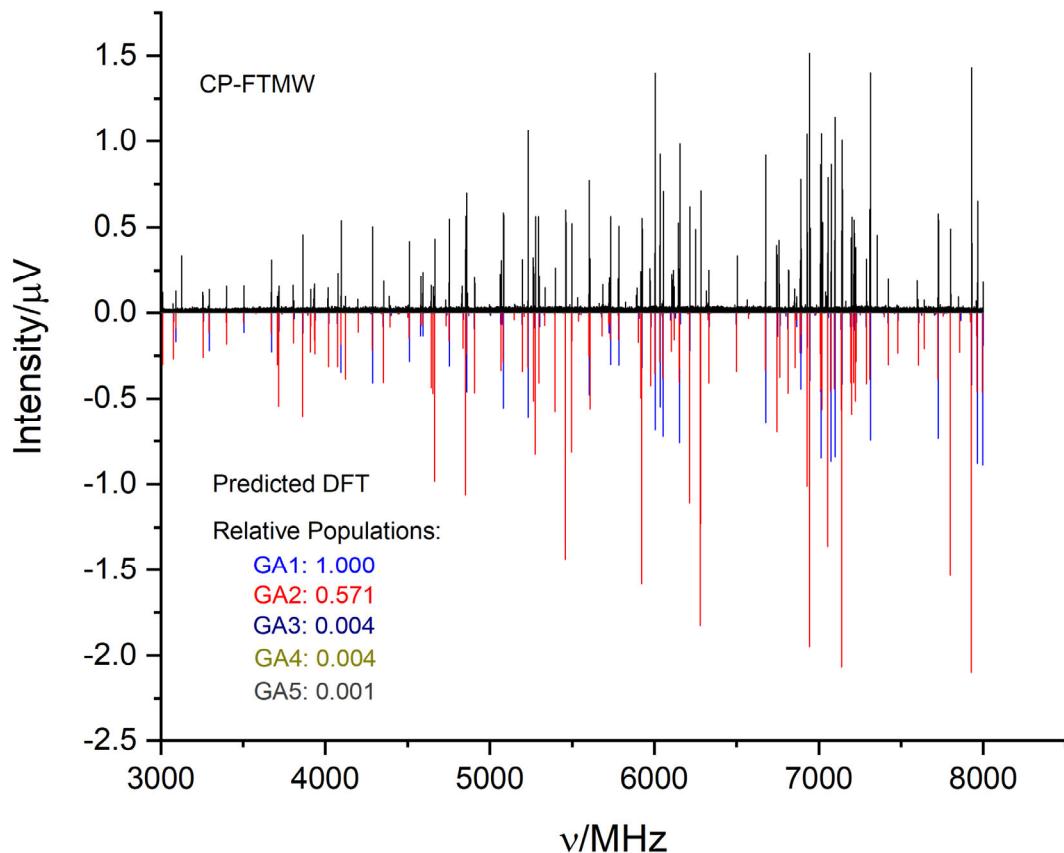

**Figure S4.** The CP-FTMW spectrum of laser ablated gallic acid in the 3-8 GHz region. The experimental spectrum (upper black trace) is compared with the spectrum predicted with the fitted rotational parameters (see Table 1) for rotamers R1 (lower blue trace) and R2 (lower red trace).

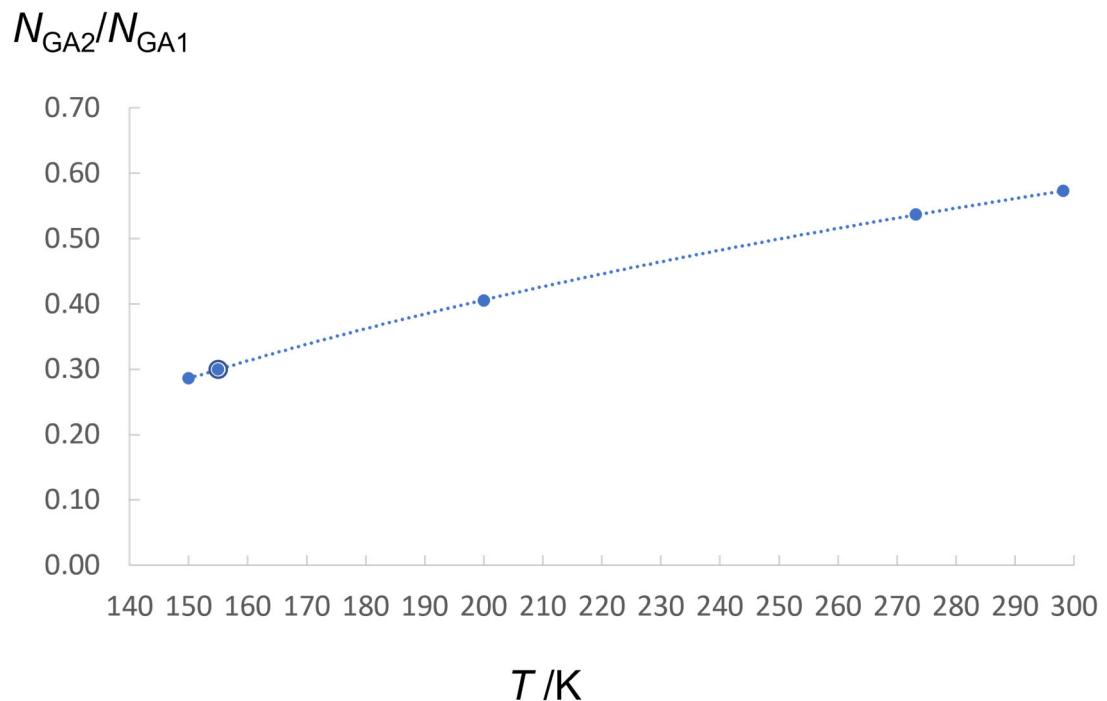

**Figure S5.** The CP-FTMW spectrum of laser ablated gallic acid in the 3-8 GHz region. The experimental spectrum (upper black trace) is compared with the spectra predicted from the DFT B3LYP-D3/6-311++G(2d,p) rotational parameters (see Table 1) for conformers GA1 (blue trace), GA2 (red trace), GA3 (navy blue trace), GA4 (dark yellow trace) and GA5 (dark gray trace) conformers. The calculated spectra intensities correspond exclusively to the calculated electric dipole components and have not been corrected for estimated populations. The spectrum of GA3 form thus corresponds to dipole moment values of  $\mu_a=0.3$  D,  $\mu_b=0.0$  D,  $\mu_c=0.0$  D.

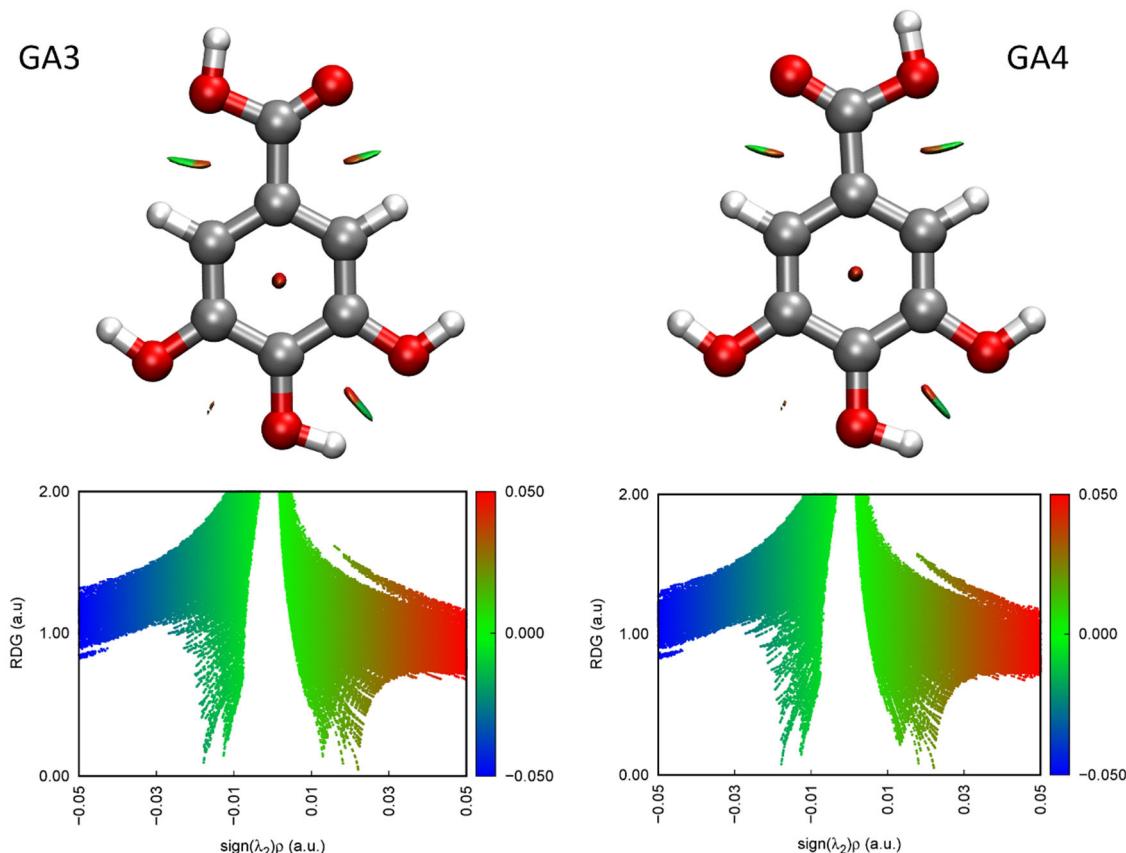

**Figure S6.** The CP-FTMW spectrum of laser ablated gallic acid in the 3-8 GHz region. The experimental spectrum (upper black trace) is compared with the sum of spectra predicted from the DFT B3LYP-D3/6-311++G(2d,p) rotational parameters (see Table 1) for conformers GA1 (blue trace), GA2 (red trace), GA3 (navy blue trace), GA4 (dark yellow trace) and GA5 (dark gray trace) conformers. The calculated spectra intensities have been corrected using relative populations predicted from Gibbs energies. Only spectra for conformers GA1 and GA2 have appreciable intensities and alone reproduce the observed spectrum.

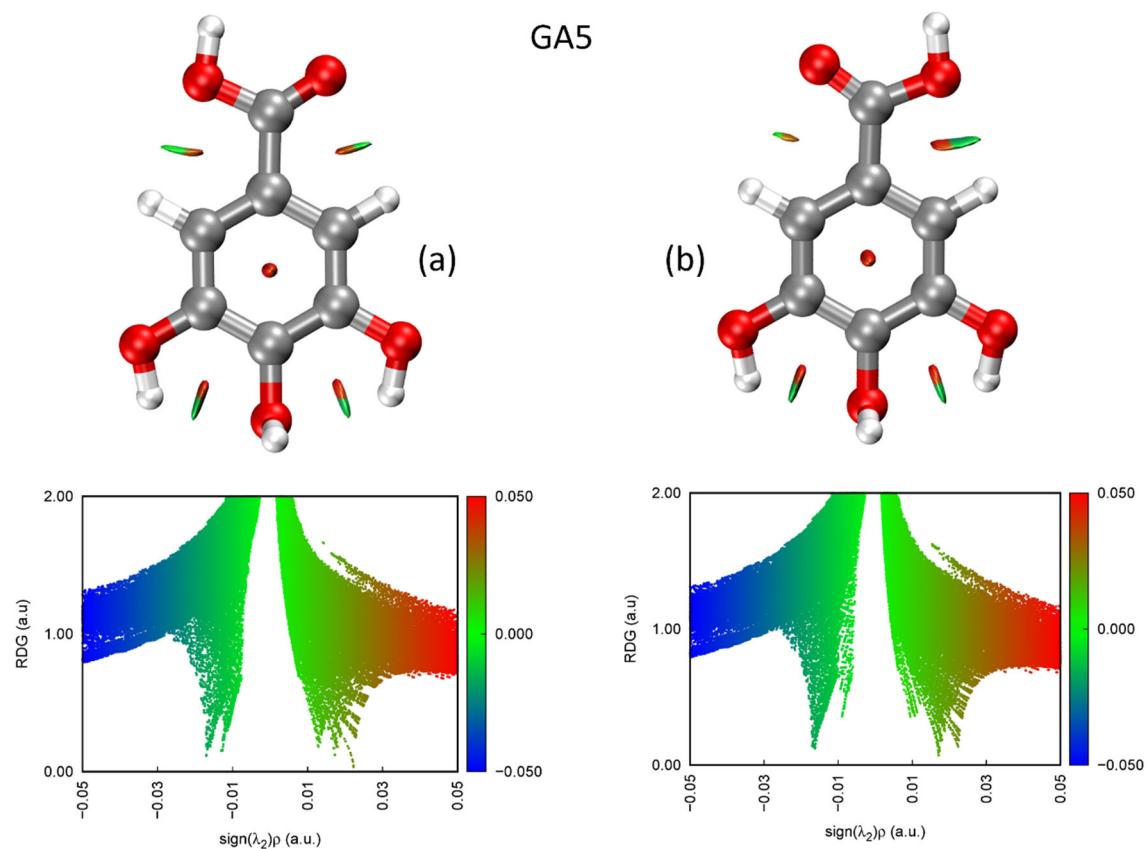

**Figure S7.** Temperature dependence of the equilibrium relative population ratio  $N_{\text{GA2}}/N_{\text{GA1}}$  of conformers GA1 and GA2 calculated from the predicted B3LYP-D3/6-311++G(2d,p) vibrational and rotational data. According to these predictions the ratio of 0.3 observed in the supersonic expansion would correspond to a temperature of 155 K.

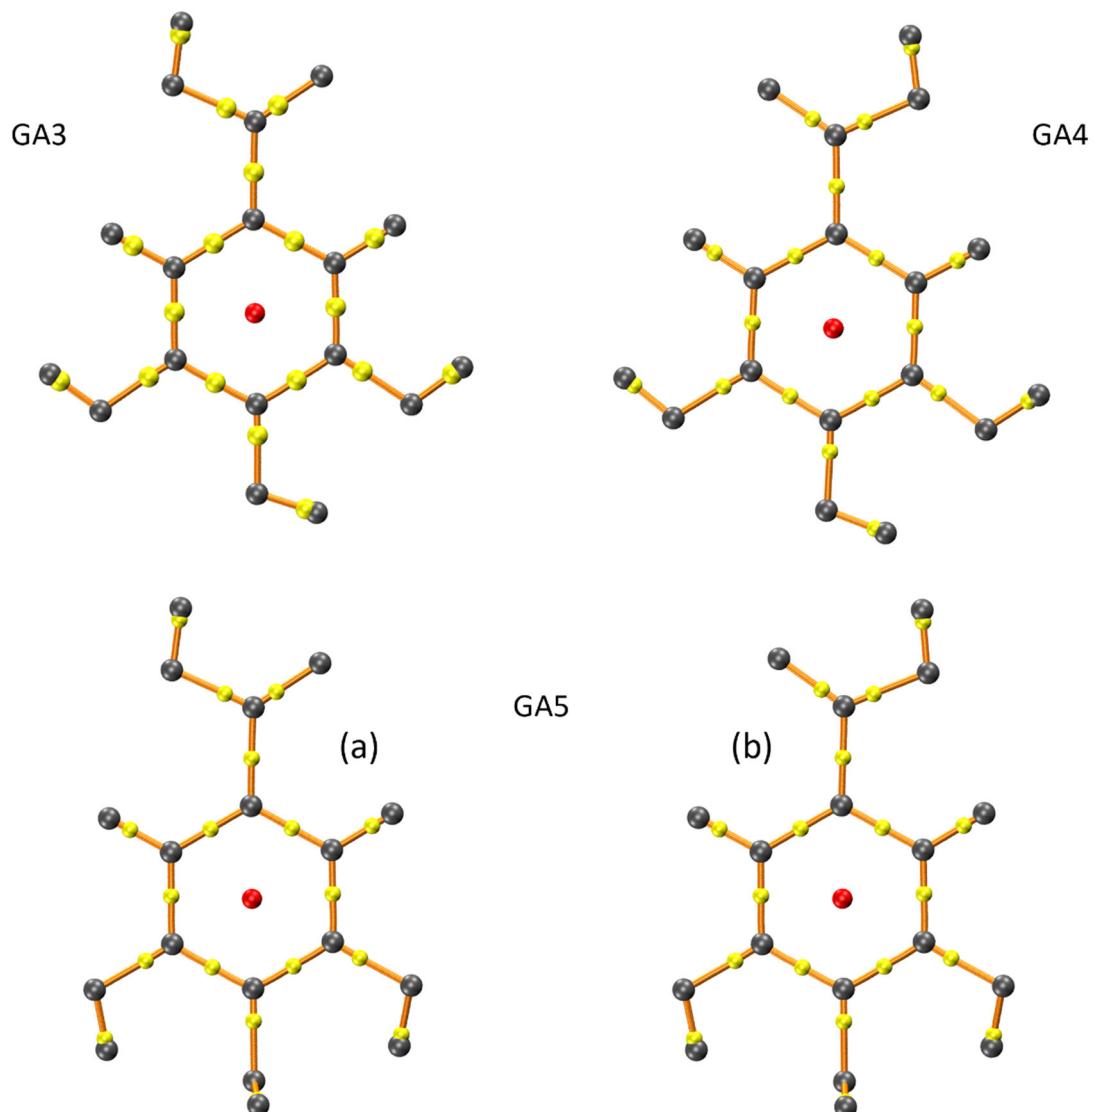

**Figure S8.** The figure shows the results of the non-covalent interaction (NCI) analysis (E. R. Johnson, *et al.*, *J. Am. Chem. Soc.* **2010**, *132*, 6498–6506) applied to conformers GA3 and GA4 of gallic acid. The equilibrium structure calculated at the B3LYP-D3/6-311++G(2d,p) has been considered. Each point in the scatter graph (see below) is a grid point in 3D space representing the reduced density gradient (RDG) vs.  $\text{sign}[\lambda_2]\rho$ .  $\lambda_2$  is the largest second eigenvalue of the Hessian matrix of the electron density  $\rho$ . The strength of weak interactions has a positive correlation with the electron density in the corresponding region. Van der Waals interaction regions always have very small  $\rho$  values, while the regions corresponding to strong steric effects and hydrogen bonding always have relatively large values  $\rho$ . A negative sign of  $\lambda_2$  indicates attractive interactions since electron density is aggregated. A positive sign of  $\lambda_2$  indicates repulsive interactions in which the electron density depletes. Thus, the product of the sign of  $\lambda_2$  and  $\rho$  allows visualizing the non-covalent interactions. The spikes in the low part of the scatter graphs represent the non-covalent interactions present. Those on the left part of the graph correspond to attractive interactions and those on the right part correspond to repulsive interactions. Points with  $\text{RGD} < 0.5 \text{ a.u.}$ , are represented in the isosurface and the strength of the interaction is identified with the color codes shown below.

**Figure S9.** The figure shows the results of the non-covalent interaction (NCI) analysis (E. R. Johnson, *et al.*, *J. Am. Chem. Soc.* **2010**, *132*, 6498–6506) applied to conformers GA5 (*a*) and (*b*) of gallic acid. The equilibrium structure calculated at the B3LYP-D3/6-311++G(2d,p) has been considered. Each point in the scatter graph (see below) is a grid point in 3D space representing the reduced density gradient (RDG) vs.  $\text{sign}[\lambda_2]\rho$ .  $\lambda_2$  is the largest second eigenvalue of the Hessian matrix of the electron density  $\rho$ . The strength of weak interactions has a positive correlation with the electron density in the corresponding region. Van der Waals interaction regions always have very small  $\rho$  values, while the regions corresponding to strong steric effects and hydrogen bonding always have relatively large values of  $\rho$ . A negative sign of  $\lambda_2$  indicates attractive interactions since electron density is aggregated. A positive sign of  $\lambda_2$  indicates repulsive interactions in which the electron density depletes. Thus, the product of the sign of  $\lambda_2$  and  $\rho$  allows visualizing the non-covalent interactions. The spikes in the low part of the scatter graphs represent the non-covalent interactions present. Those on the left part of the graph correspond to attractive interactions and those on the right part correspond to repulsive interactions. Points with  $\text{RGD} < 0.5$  a.u., are represented in the isosurface and the strength of the interaction is identified with the color codes shown below.

**Figure S10.** Molecular graph showing the results of the QTAIM analysis of conformers GA3, GA4 and GA5 of gallic acid. Critical points are depicted with different colors, grey for the (3,-3) maxima locating the atoms, yellow for the (3,-1) bond critical points (BCP), and red (3,1) ring critical points (RCP). Bond paths (BP) are shown in orange. The equilibrium structures calculated at the B3LYP-D3/6-311++G(2d,p) has been considered. As can be seen, there are no BCP locating possible hydrogen bonds between OH groups.

**Table S1.** Rotational parameters, electric dipole moment components, and energies for the five conformers of gallic acid calculated at B3LYP-D3/6-311++G(2d,p) level of theory.
