

Supplemental Material-I

High-pressure Limit and Pressure-dependent Rate Rules for β -scission Reaction Class of Hydroperoxyl alkyl hydroperoxyl radicals ($\bullet\text{P}(\text{OOH})_2$) in Normal-alkyl Cyclohexanes Combustion

Contents:

1. The spin eigenvalues and the S^2 computed by Gaussian 16 package for the species involved in this work
2. The representative IRC profiles for reactions involved in this work
3. Lennard-Jones parameters used in this work
4. Potential energy profiles of internal rotations for reactions involved in this work
5. Cartesian coordinates for all reactants, transition states and products in the class of β -scission reaction

1. The spin eigenvalues and the S^2 computed by Gaussian 16 package for the species involved in this work

Table S1. Comparison between the spin eigenvalues and the S^2 computed by Gaussian 16 package for the species.

| Species | Spin eigenvalues | $\langle S^2 \rangle$ | Relative error (%) |

4. Potential energy profiles of internal rotations for reactions involved in this work

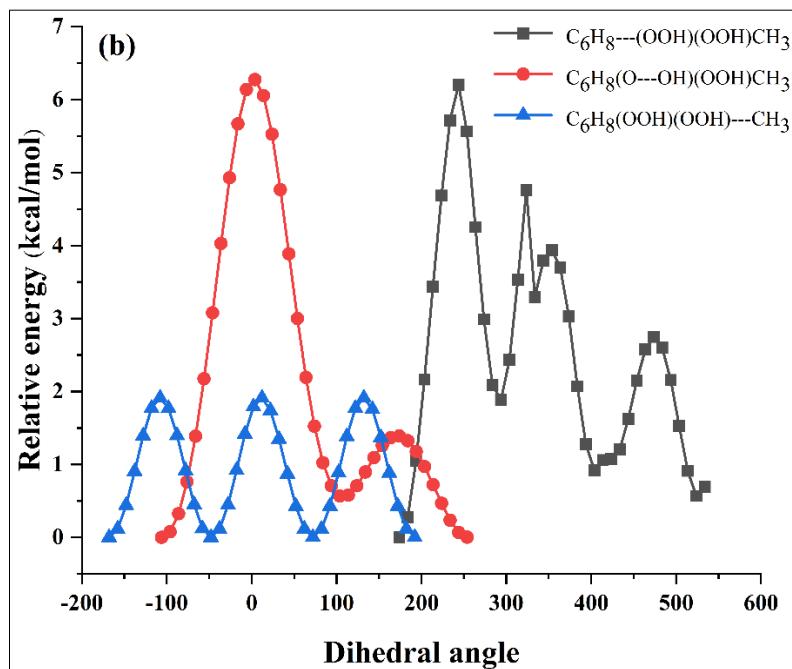

In our study, one-dimensional (1-D) hindered internal rotors are used to treat low-frequency vibrations corresponding to torsions about a single bond for reactants, transition states and products. When dealing with the hindrance potentials of transition states, 1-D hindered rotor scans are implemented by freezing the atoms involved in the reaction centers. Since cyclohexane has a relatively stable cycle structure, the anharmonic correction corresponding to the internal rotations of the single bond on the cycle of the reactants, transition states, and products in this work are all not considered. Here, we only choose the R21 reaction as an example, and the potential energy profiles for internal rotations about C-C, C-OO and CO-OH single bonds of the reactant, the transition state, and the product in R21 are shown in Figure S2(a), Figure S2(b), and Figure S2(c).

Figure S2(a). Potential energy profiles for internal rotations of the reactant in R21 at B3LYP/CBSB7 level.

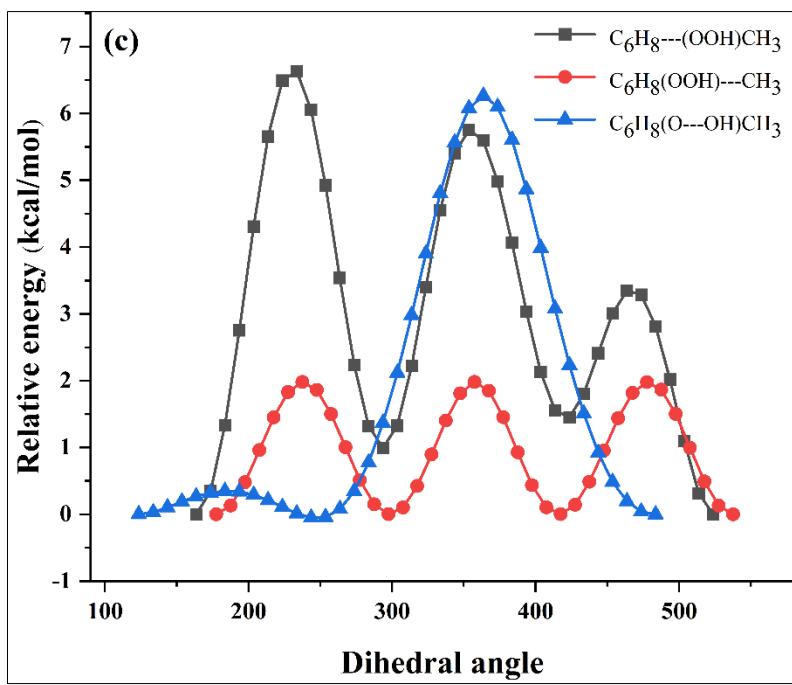

For the reactant, it can be seen from Figure S2(a) that the calculated rotational profile of C₆H₈(OOH)---(OOH)CH₃ group in reactant shows an asymmetrical three-fold potential barrier of 7.0 kcal mol⁻¹. The rotation of the C₆H₈---(OOH)(OOH)CH₃ group shows an asymmetrical three-fold potential barrier of 10.8 kcal mol⁻¹. The rotations of the C₆H₈(OOH)(OOH)---CH₃ group shows a symmetrical three-fold potential barrier of 3.1 kcal mol⁻¹. The rotations of the

$\text{C}_6\text{H}_8(\text{OOH})(\text{O---OH})\text{CH}_3$ group and the $\text{C}_6\text{H}_8(\text{O---OH})(\text{OOH})\text{CH}_3$ group in reactant show asymmetrical two-fold potential barriers of 6.3 and 5.4 kcal mol⁻¹, respectively.

For the transition state, there are only three potential energy profiles for internal rotations about single bonds because the anharmonic correction corresponding to the single bonds involved in the reaction centers are not considered. It can be seen that from Figure S2(b) that, the calculated rotational profile of C_6H_8--- (OOH)(OOH)CH₃ group in transition state shows an asymmetrical three-fold potential barriers of 6.2 kcal mol⁻¹, and the rotation of $\text{C}_6\text{H}_8(\text{O---OH})(\text{OOH})\text{CH}_3$ group in transition state shows an asymmetrical two-fold potential barriers of 6.3 kcal mol⁻¹. The rotation of the $\text{C}_6\text{H}_8(\text{OOH})(\text{OOH})\text{---CH}_3$ group in transition state shows a symmetry three-fold barrier of 1.9 kcal mol⁻¹.

From Figure S2(c), it can be seen that, the calculated rotational profile of C₆H₈---(OOH)CH₃ group shows an asymmetrical three-fold with a barrier of 6.6 kcal mol⁻¹. The calculated rotational profile of C₆H₈(OOH)---CH₃ group shows a symmetrical three-fold with a barrier of 2.0 kcal mol⁻¹. The C₆H₈(O---OH)CH₃ group in product show an asymmetrical two-fold potential barrier of 6.3 kcal mol⁻¹.

5. Cartesian coordinates for all reactants, transition states and products in the class of β -scission reaction
