As part of a research programme targeting novel indole-like molecules as potential cannabinoid agonists [1-4] we synthesised N-(2-ethylmorpholino)-3-bis-ketothiene.

N-(ethylmorpholine) oxindole (220.0 mg, 0.894 mmol) was dissolved in anhydrous DMF (5.0 mL) and the reaction mixture was cooled to 0°C in an ice-bath then DMAP (241.0 mg, 1.97 mmol) was added followed by 2-thiophenecarbonyl chloride (105.0 mL, 0.984 mmol) in anhydrous DMF (2.0 mL). The reaction was allowed to stir for 30 minutes. The reaction mixture was poured in a solution of water (9.0 mL) and 5N HCl (402.0 mL). The reaction mixture was stirred at ice-water temperature for 5 minutes, and the aqueous phase was extracted with ethyl acetate, dried over magnesium sulphate, filtered and evaporated under reduced pressure to afford the desired N-(ethylmorpholino)-3-bis keto-2-thenoyl) oxindole as a yellow powder.

M.p. 80-85 °C.
