The Mannich bases of cyclohexanone with benzylamine and 3,4-methylenedioxybenzylamine hydrochlorides have been prepared in moderate yields using aqueous formaldehyde solution [1]. We report now the synthesis of an analogous product from $(\mathrm{R})-(+)-1$-phenylethylamine. A mixture of cyclohexanone ( $2.00 \mathrm{~g}, 0.02 \mathrm{~mol}$ ), paraformaldehyde $(1.20 \mathrm{~g}, 0.04 \mathrm{~mol})$ and $(+)-(R)$-1-phenylethylamine hydrochloride ( $3.18 \mathrm{~g}, 0.02 \mathrm{~mol}$ ) was refluxed under stirring in anhydrous ethanol ( 15 ml ) for 5 h (TLC monitoring). The reaction mixture gradually turned into a solution. The solvent was then removed under reduced pressure and the residue was triturated with ice-cooled acetone ( 20 ml ). The separated crystals were filtered, washed with cold acetone, recrystallized from $n$-butanol and air-dried. Yield: 3.45 g ( $60 \%$ ) of the title compound as colorless crystals. TLC homogeneous, optically active mixture of $(R, R)$ - and $(R, S)$-diastereomers (TLC: silica gel Merck GF254 Al-sheets, eluted by chloroform-ethanol 3:1).
