

Figure S1. ABA promotes the induction of pear lateral flower bud endo-dormancy. The shoots were collected on 15 October, 2016. The shoots were dipped in 100, 200 and 300 μ M ABA or water with 0.02% Triton X-100 (control) for 24, 48, and 96 h. After the ABA treatment, shoots were placed in water for the next 21 days under forcing conditions before measuring the bud-break percentage. The bud-break experiment was performed with three biological replicates and each bar represents the mean $\pm$ SEM.

Figure S2. Dormancy-induced stimuli modulate the transcription of ABA-responsive genes. Total RNA was extracted from the control and 300 μ M ABA-treated buds sampled at 24, 48, and 96 h, as well as 1, 3, 7, 14, and 21 days after treatment. Relative expression levels of ABA-responsive genes were determined by qRT-PCR as described in the Materials and Methods, and normalized against *PpACTIN*. The bars represent the mean $\pm$ SEM of three biological repeats.

Figure S3. Multiple sequence alignment of *PpCYP707A-3* with *PpCYP707A1* (ppa005059m), *PpCYP707A2* (ppa005020m), *PpCYP707A3* (ppa005226m) protein sequences use DNAMAN 6.0.

Figure S4. The photo of typical flower bud break. The beginning of bud break was defined as green leaf tips enclosing visible flowers.

Table S1. Primers used to quantify the expression levels of ABA metabolic signaling genes and reference genes.
