

Supplementary Material:

Figure S1. Time-dependent changes in SCr levels in the liver transplant patients who experienced tacrolimus-induced AKI (A,B) and non-AKI patients (C–G) during the period of Postoperative Days 0–14 are summarized. Elevation of SCr within three postoperative days was diagnosed as tacrolimus-unrelated AKI by the physicians because the induction of tacrolimus was set on Postoperative Day 2 or after.
