PTCA: pyrrole-2,3,5-tricarboxylic acid, PDCA: pyrrole-2,3-dicarboxylic acid, PTeCA: pyrrole-2,3,4,5-tetracarboxylic acid, TTCA: thiazole-2,4,5-tricarboxylic acid, TDCA: thiazole-4,5-dicarboxylic acid , 4-AHP: 4-amino-3-hydroxyphenylalanine

**Figure S1**

The age dependence of mean cross-sectional area of Japanese female hair samples used in this study.

**Figure S2**

The  $L^*$ ,  $a^*$ , and  $b^*$  values of the hair samples plotted against mean cross-sectional area of hair samples used in this study.  
 $p = 0.63$  ( $L^*$ ), 0.28 ( $a^*$ ), and 0.12 ( $b^*$ ).

### Figure S3

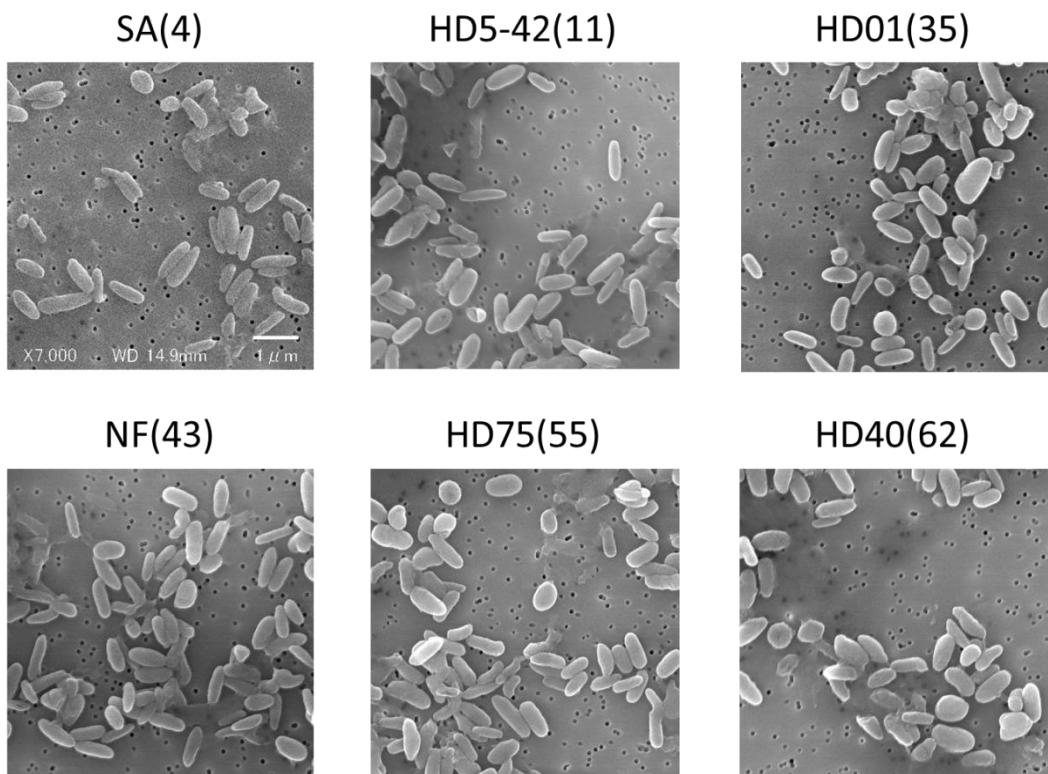

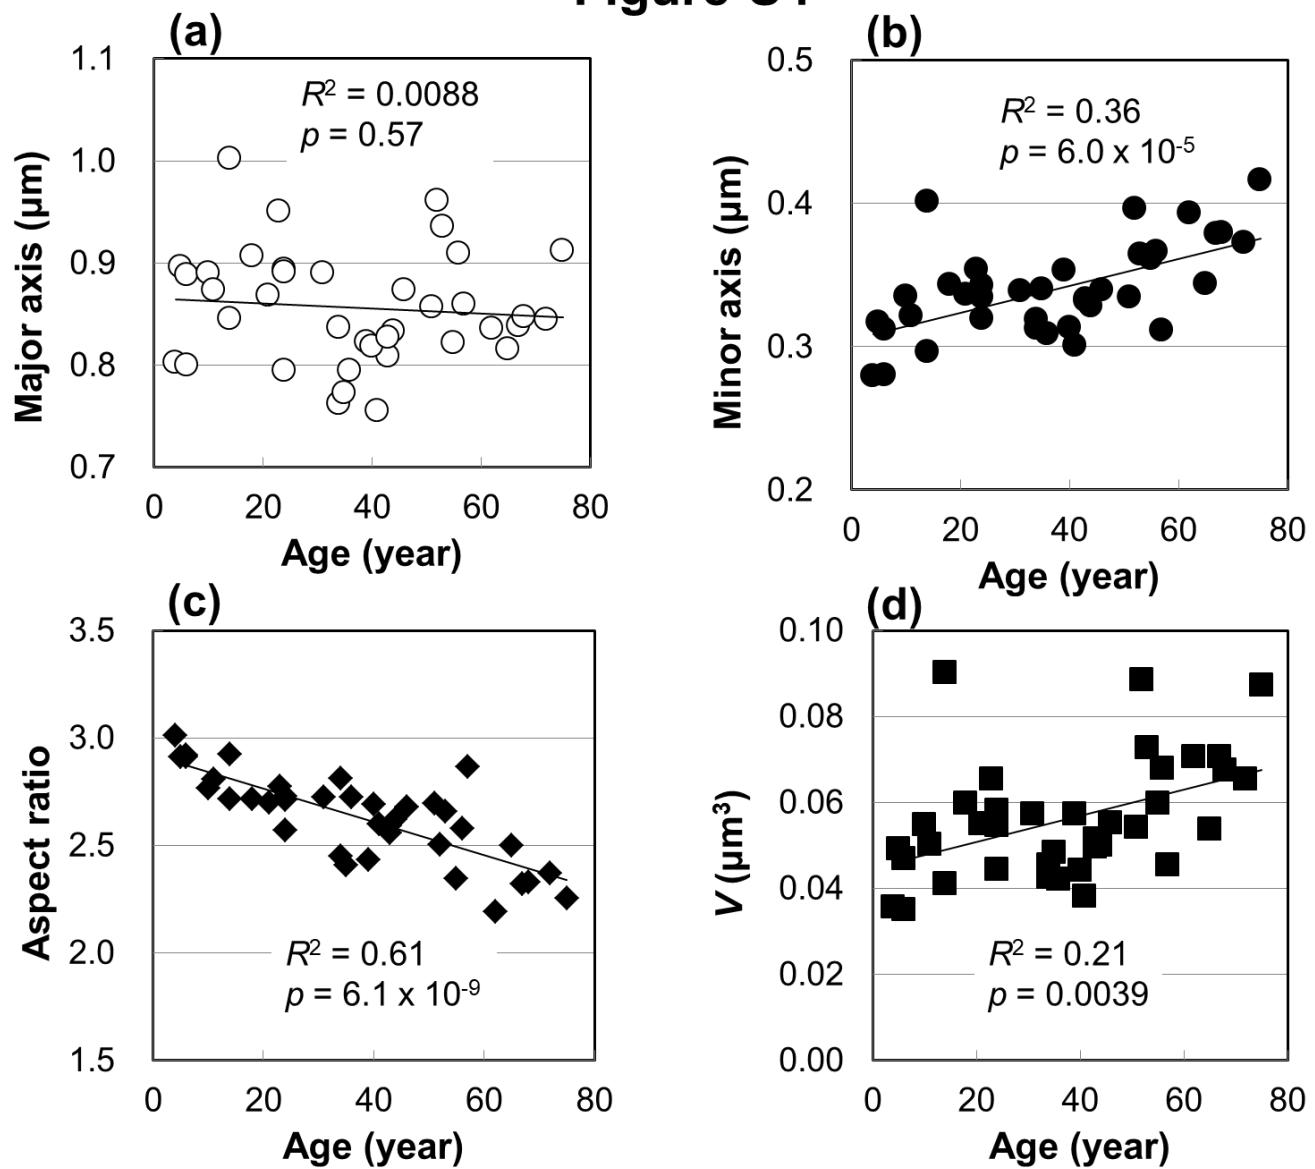

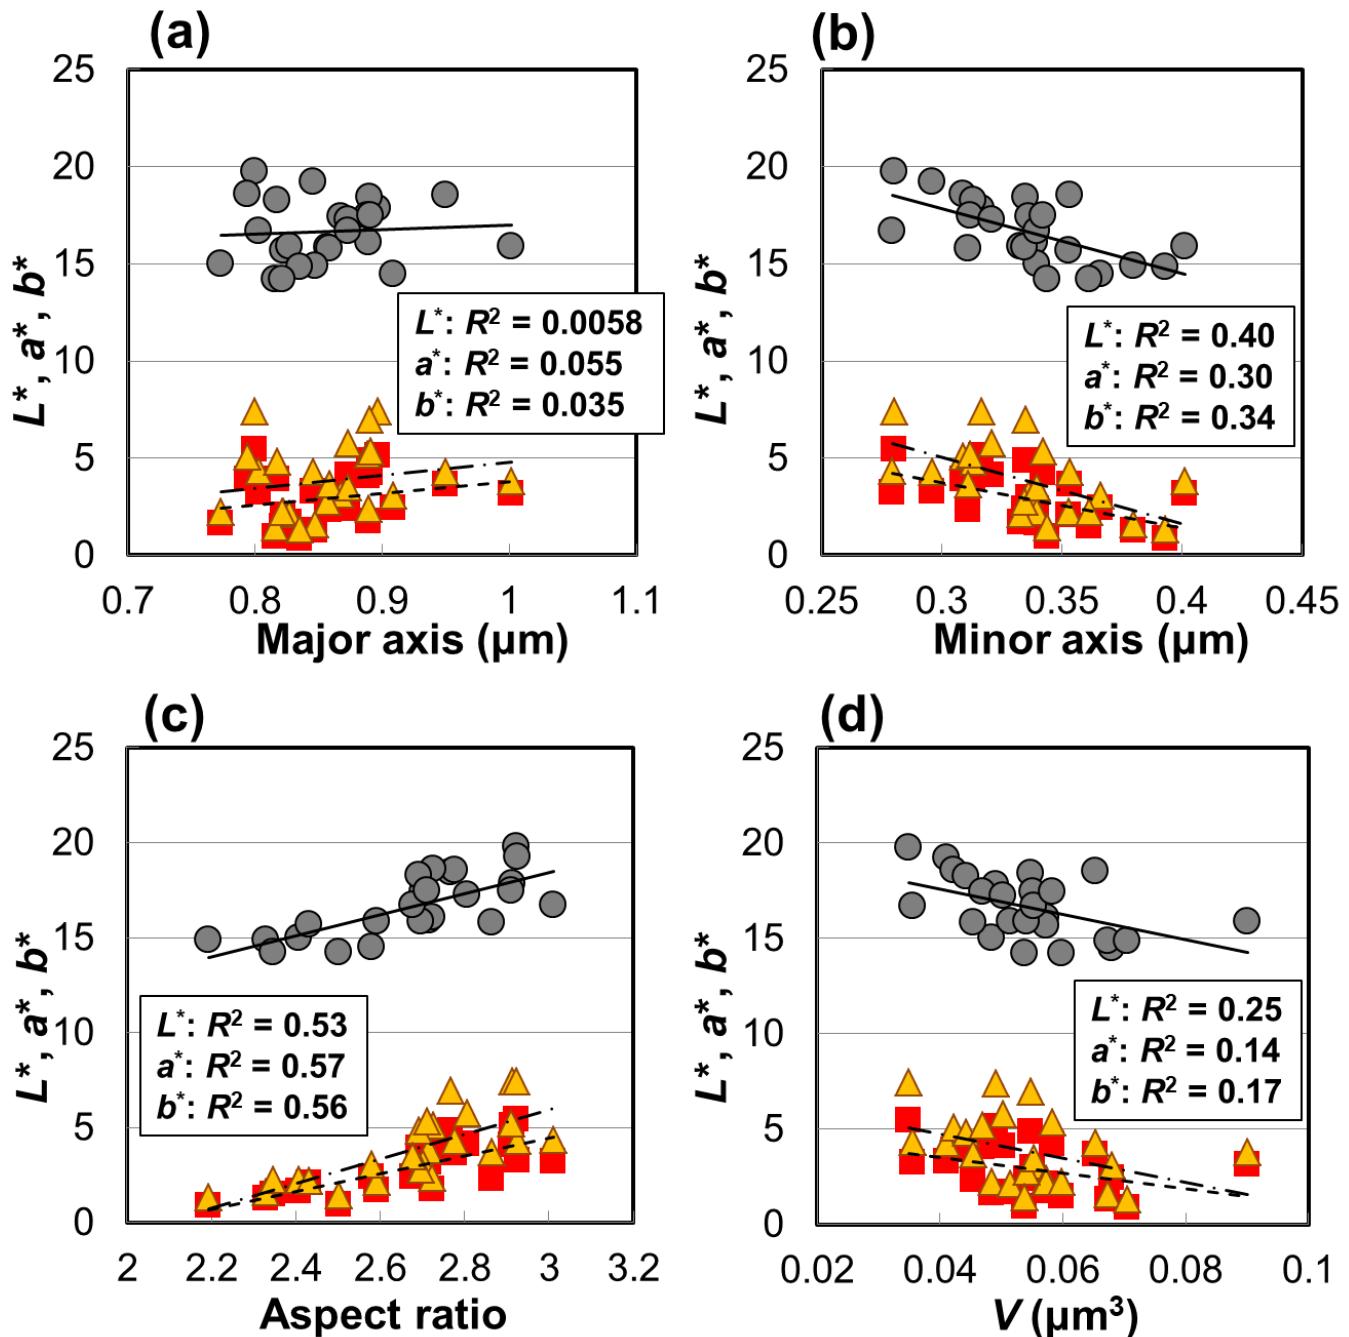

Figure S3 shows representative SEM images of melanosomes isolated from non-chemical-treated Japanese female pigmented hairs. Sample names are shown above the images. Numbers in parentheses are the age of the subjects. The scale bar in the figure of SA (upper and leftmost) means 1  $\mu\text{m}$  and the magnification of all pictures are the same. Isolated melanosomes are ellipsoidal forms on the whole. Small dots with the dimension of 0.1  $\mu\text{m}$  are pores of the membranes.

# Figure S4

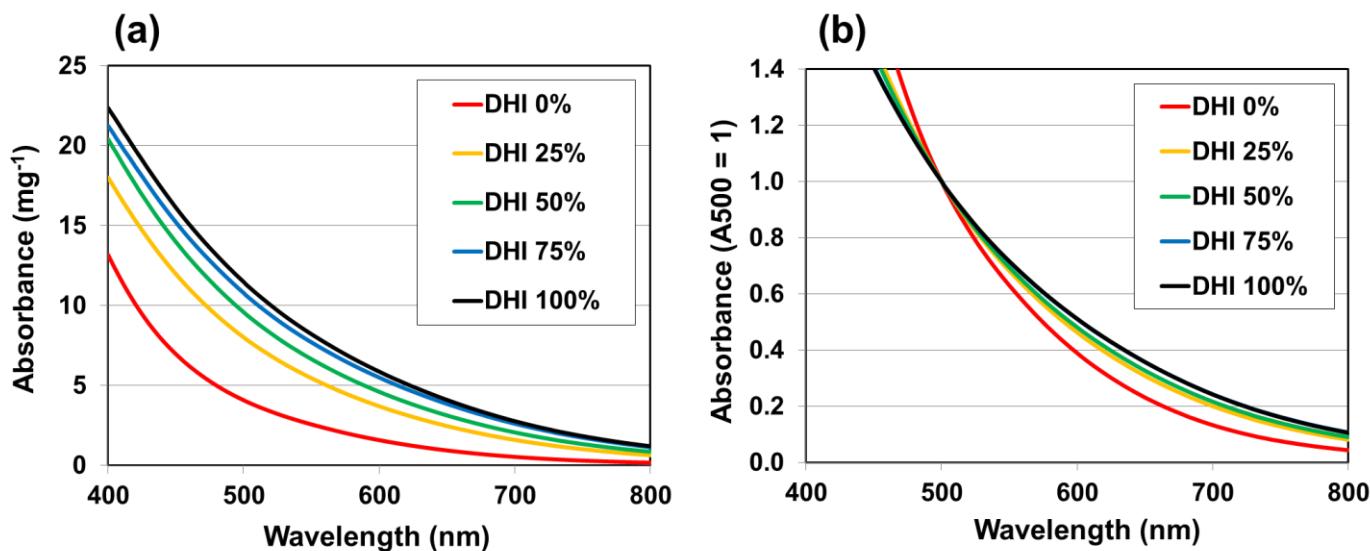

The age dependences of the morphological parameters determined for the melanosomes isolated from non-chemical treated Japanese female pigmented hairs in their age from 4 to 75. (a) Mean major axis. (b) Mean minor axis. (c) Mean aspect ratio. (d) Mean volume  $V$  with an assumption of ellipsoid.

# Figure S5

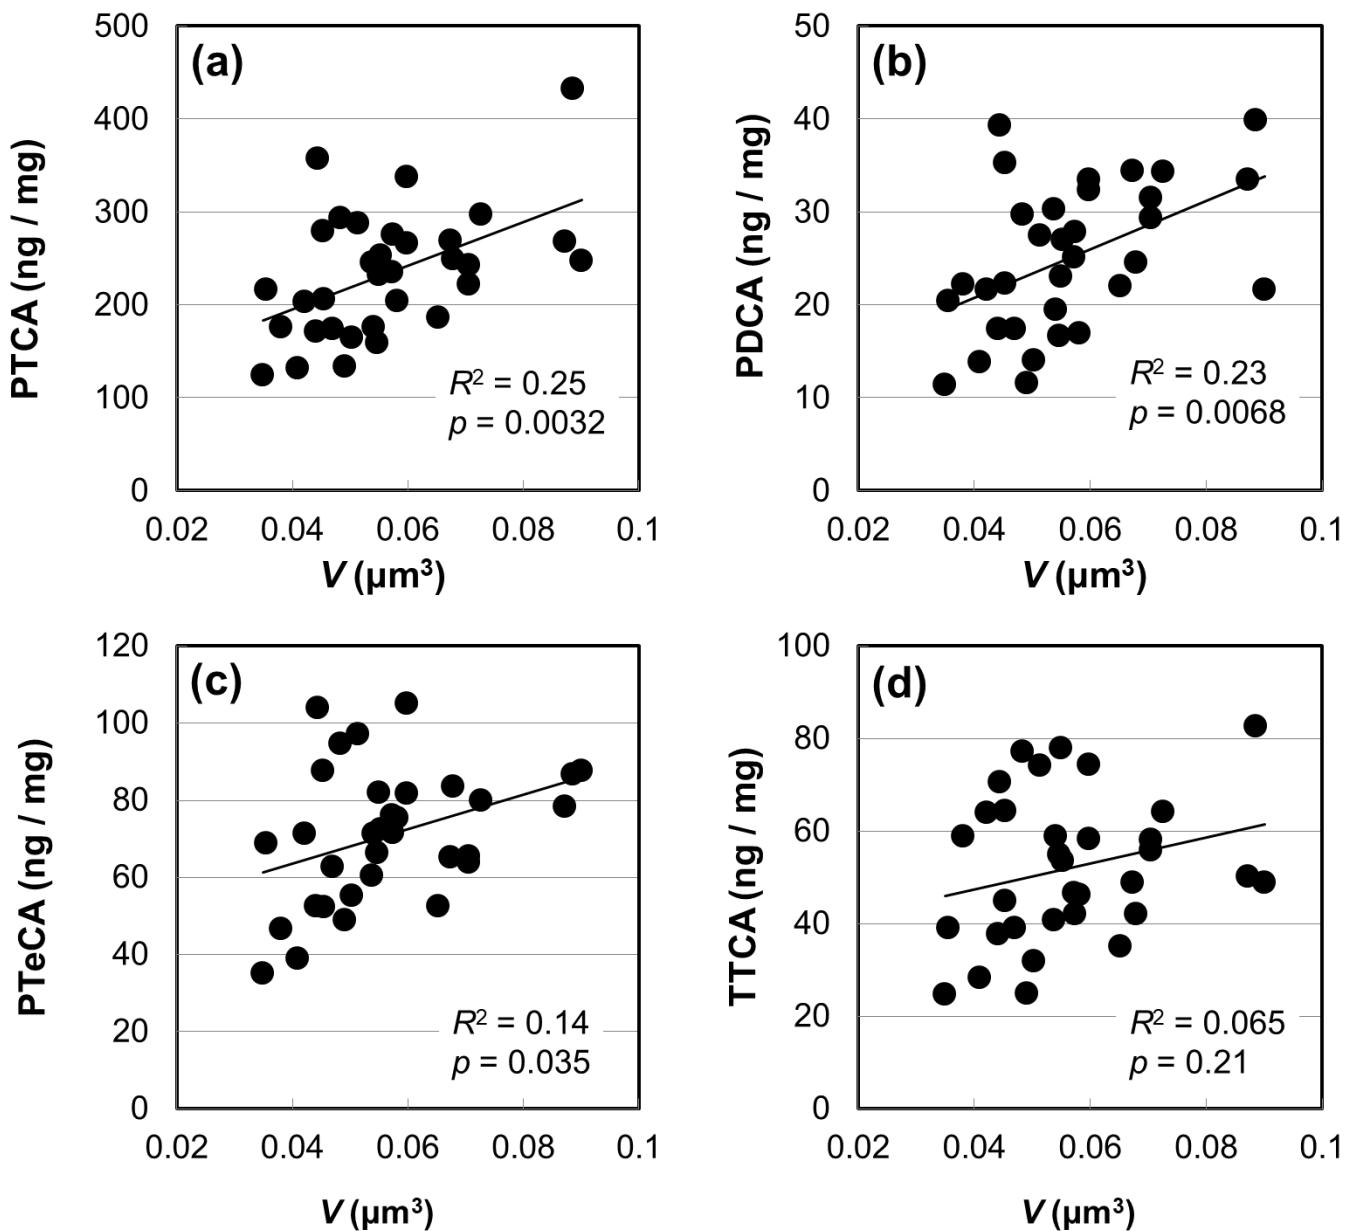

The  $L^*$ ,  $a^*$ , and  $b^*$  values of the hair samples plotted against morphological parameters determined for the melanosomes isolated from non-chemical treated Japanese female pigmented hairs in their age from 4 to 68.

**Figure S6**

Absorption spectra of melanins synthesized from DHI and DHICA mixtures with various mol% of DHI. (a) Absorbance reduced by the mass of synthesized melanin. (b) Relative absorbance of synthesized melanin ( $A_{500} = 1$ ).

## Figure S7

Correlations of various levels measured by hair melanin analyses vs.  $V$ . (a) PTCA, (b) PDCA, (c) PTeCA, (d) TTCA. As a whole, all levels have positive correlations with  $V$ . The levels of PTCA, PDCA, and PTeCA show significant correlations with  $V$ , while TTCA level does not.

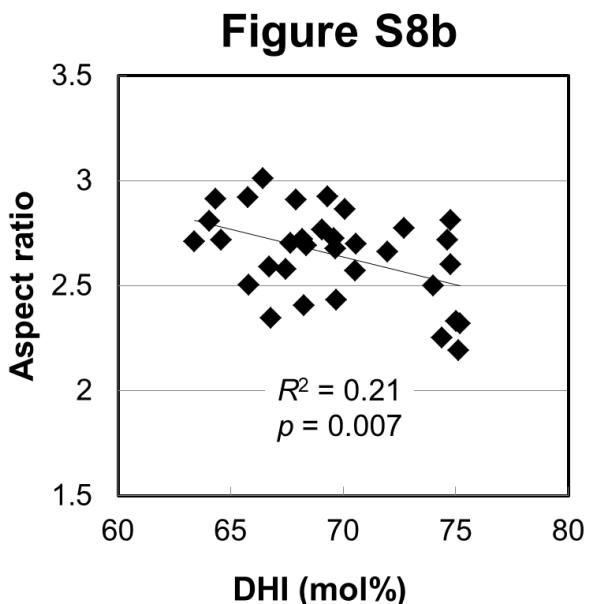

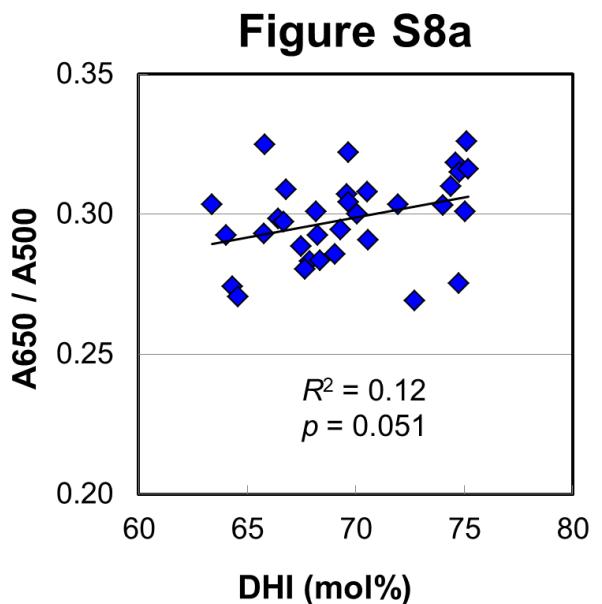

Figure S8a shows the contribution of DHI mol% on  $A_{650}/A_{500}$  of Soluene-350 solution of hair melanin. This shows that DHI mol% has a weak positive correlation with  $A_{650}/A_{500}$ .

Figure S8b shows the contribution of DHI mol% to the aspect ratio of the isolated melanosome, suggesting that the aspect ratio significantly decreases with the increase in DHI mol%.

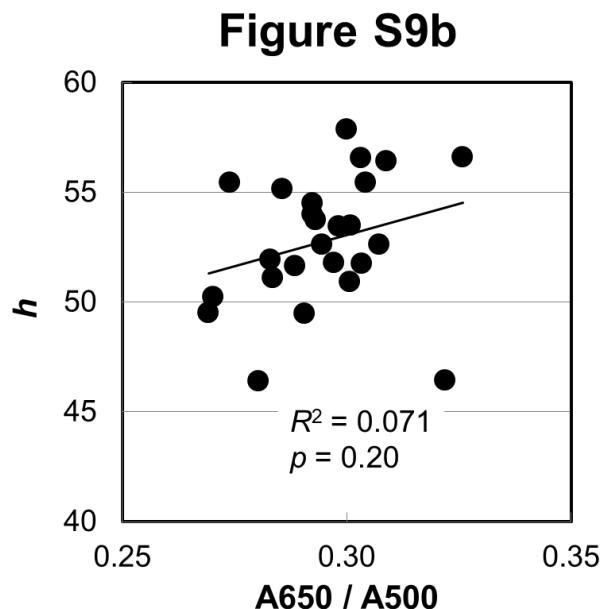

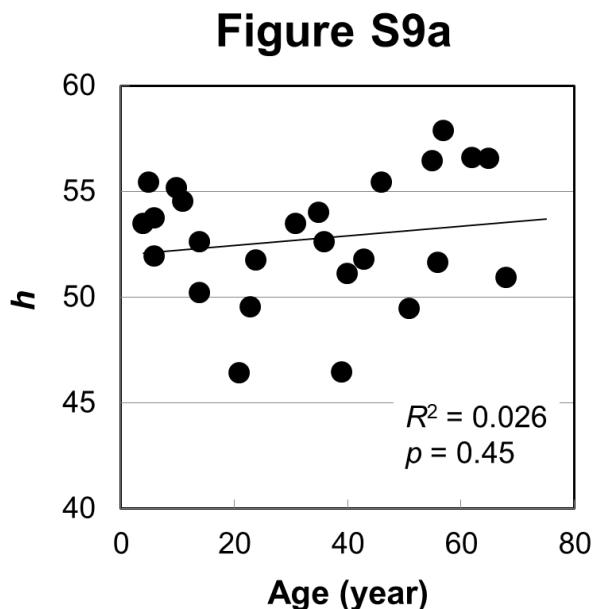

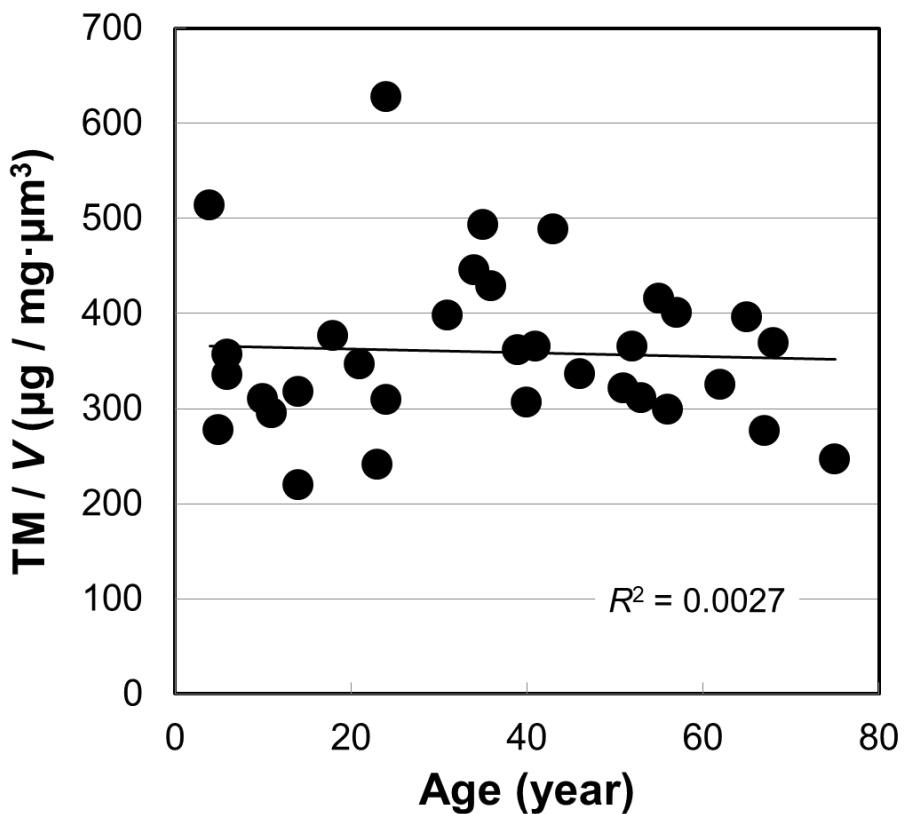

Figure S9a shows the age dependence of Metric Hue-Angle  $h$  determined from  $a^*$  and  $b^*$  values of hair bundles. There is no significant correlation. Figure S9b shows the relationship between  $h$  and the ratio of absorbance ratio  $A_{650}/A_{500}$  of Soluene-350 solution of hair melanin. There is no significant correlation.

## Figure S10

The age dependence of the evaluated parameter proportional to the melanin density in melanosomes.

## Figure S11

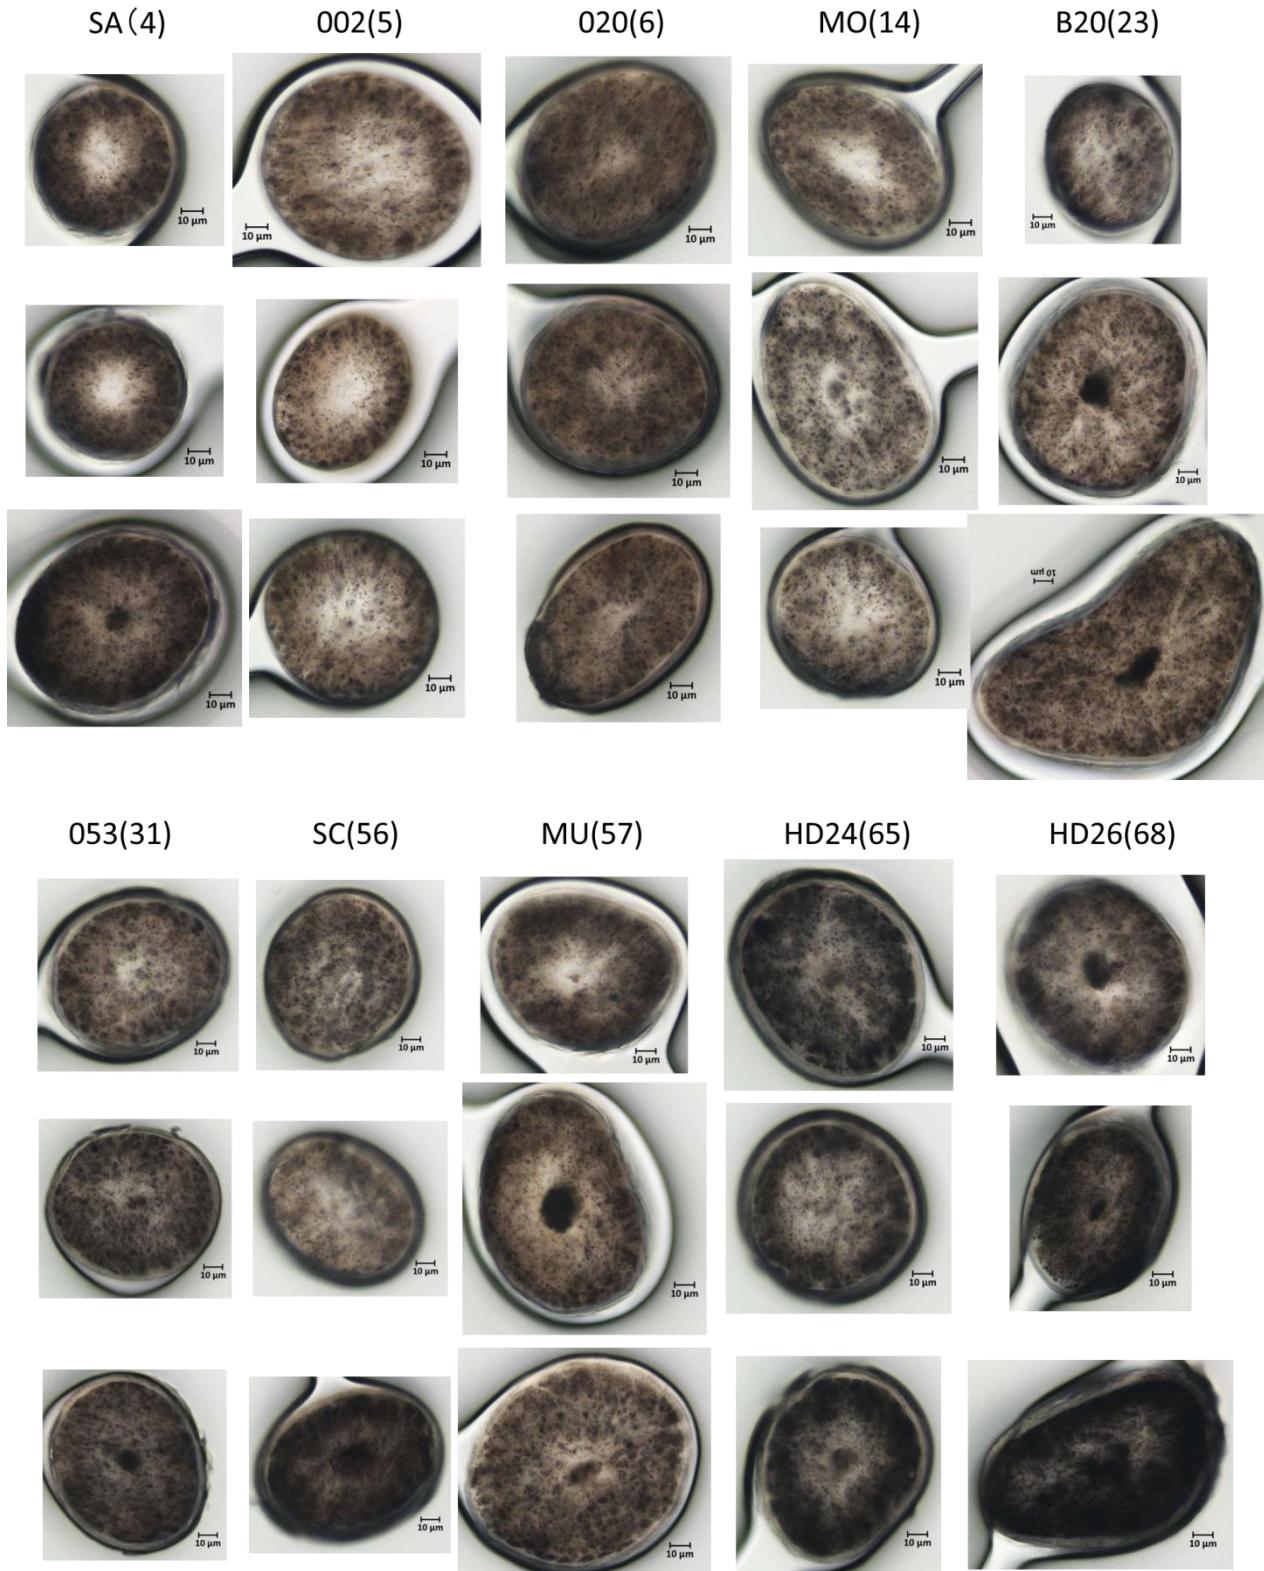

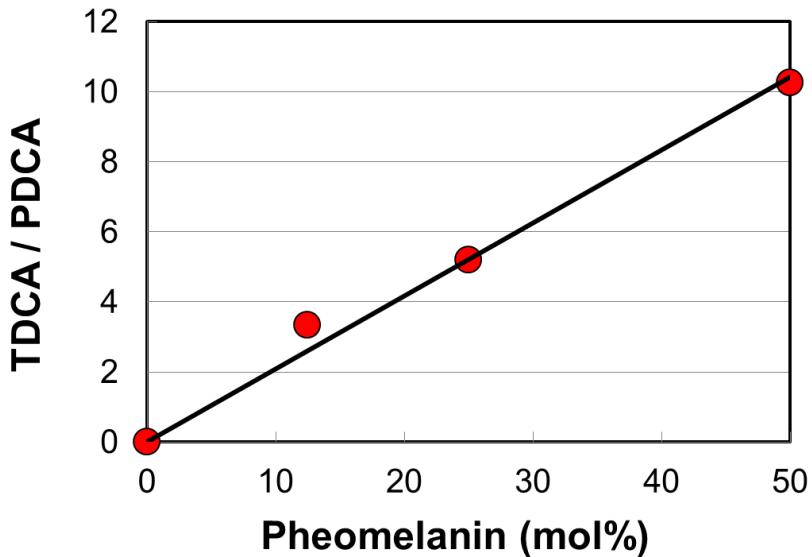

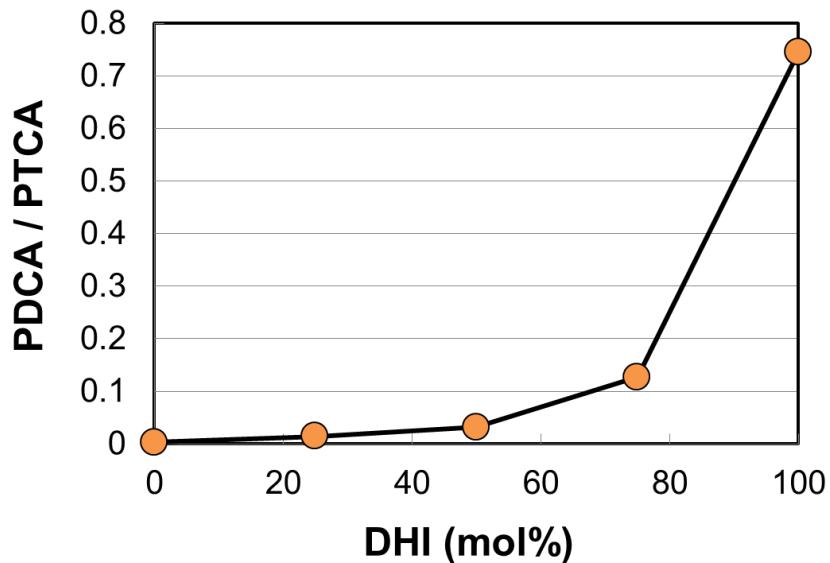

Figure S11 shows the optical microscope images of hair cross sections with the thickness of 10  $\mu\text{m}$  for three hair fibers randomly selected from 10 subjects. Numbers in parenthesis are the age of the subjects. The distribution of melanin looks uniformly or periphery in hair cross-section and it has no age trend. It is noteworthy that the color shade of hairs over 60 looks more black.

### Figure S12

The calibration curve of TDCA/PDCA vs. Pheomelanin mol% in HCl-hydrolyzed melanins [12].

### Figure S13

The calibration curve of PDCA/PTCA vs. DHI mol%.
