

Supplemental Figure 1. Effect of CYLD down-regulation on cisplatin sensitivity in various types of OSCC cell lines. (a) HSC-3 cells and (b) Ca9-22 cells were transfected with control siRNA (siCon) or CYLD-specific siRNA (siCYLD) and then treated with cisplatin. The cell survival rates of those cells after cisplatin treatment (0 ~ 10 μg/mL) were assessed. Values are means ± SD of triplicate samples. ** $p < 0.01$ vs siCon group.
