

Supplementary figure S1. Notch signaling promotes melanoma invasion. WM3314 cells were treated with 20 μ M PF3084014 and an invasion assay was conducted. Graph demonstrates proportion (%) of invading cells from the total seeded cells, and a representative image of invading cells is shown for each treatment in the lower panel; blue is DAPI nuclear staining. Error bars represent \pm SEM, * indicates $p < 0.05$ ($n = 4$).
