\*The odds ratio was adjusted by age. RPL, recurrent pregnancy loss; CFD, complement factor D; CFH, complement factor H; AOR, adjusted odds ratio; 95% CI, 95% confidence interval; PLT, platelet; PT, prothrombin time; aPTT, activated partial thromboplastin time; BMI, body mass index.

† PLT 304×10<sup>3</sup>/μl indicates the upper 15% cut-off level in RPL patients and controls.

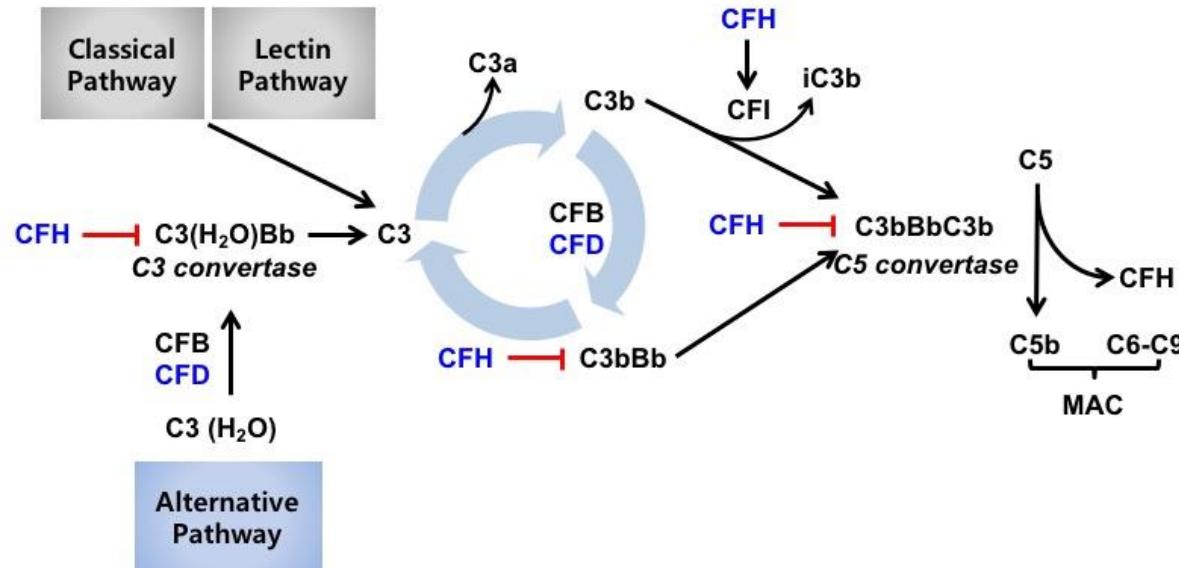

‡ PT 10.4 sec, aPTT 26.8 sec indicates the lower 15% cut-off levels in RPL patients and controls.

**Supplementary Table 3. Clinical variables in recurrent pregnancy loss patients stratified by *CFD* and *CFH* polymorphisms status by ANOVA.**

ANOVA, analysis of variance; SD, standard deviation; FSH, follicle stimulating hormone; CFD, complement factor D; CFH, complement factor H.

<sup>a</sup> ANOVA test, <sup>b</sup> Kruskal-Wallis test.

**Supplementary Figure 1.** The three pathways of complement activation. Black arrow indicates triggering of complement cascades. Deposition of C3b on a target sets in motion the powerful amplification loop of the alternative pathway. The C3b deposition and C3a release generate the downstream mediators C5b-9. C3 is regulated by both CFH and CFD and C3 has been found to be associated with RPL.

CFH, complement factor H; CFI, complement factor I; CFB, complement factor B; CFD, complement factor D; MAC, membrane attack complex.

**Supplementary Figure 2.** Association between homocysteine levels and the *CFH* rs1065489G>T polymorphisms in control group.
