

Table S1. Values for the degree of agreement μ_{C_k, C_l} between the leaf anatomical and physiological parameters determined in Italian (IT) and Bulgarian (BG) populations of *P. orientalis* plants under control (FTSW = 95%) and drought (FTSW = 28%) conditions. LT – leaf thickness, PP – palisade parenchyma, SP – spongy parenchyma, AdE – adaxial epidermis, AbE – abaxial epidermis, InS – intercellular space, A_{sat} – CO₂ saturated photosynthetic rate, V_{cmax} – maximum carboxylation rate of Rubisco, J_{max} – maximum rate of photosynthetic electron transport, TPU – triose phosphate utilization, v_c – carboxylation rate, v_o – oxygenation rate, R_p – photorespiration, g_m - mesophyll conductance. The IT population data are shown in upper triangle of the table, while those for BG population – in the lower triangle. The degrees of agreement showing positive correlations are presented in blue color, those showing the negative correlations – in red color.
