**Supplementary Figure S1.** Differential gene expression data analysis of the in vivo RNA sequence data. (A) K-means clustering is applied for clustering genes into groups based on their gene expression patterns across Calr $^{+/+}$ , Calr $^{+/-}$ , and Calr $^{-/-}$  samples. Firstly, genes are ranked by standard deviation and the top 1000 genes are used for clustering. (B) Principal component analysis (PCA) projecting three distinct genotypes on two dimensional space showing the variance between distinct groups represented in the  $x$  and  $y$  axes. (C) PCA loadings on gene expression data used to run pathway analysis with the PGSEA package. The adjusted  $p$ -values are used in order to rank the KEGG pathway enrichments for each of the three principal components.

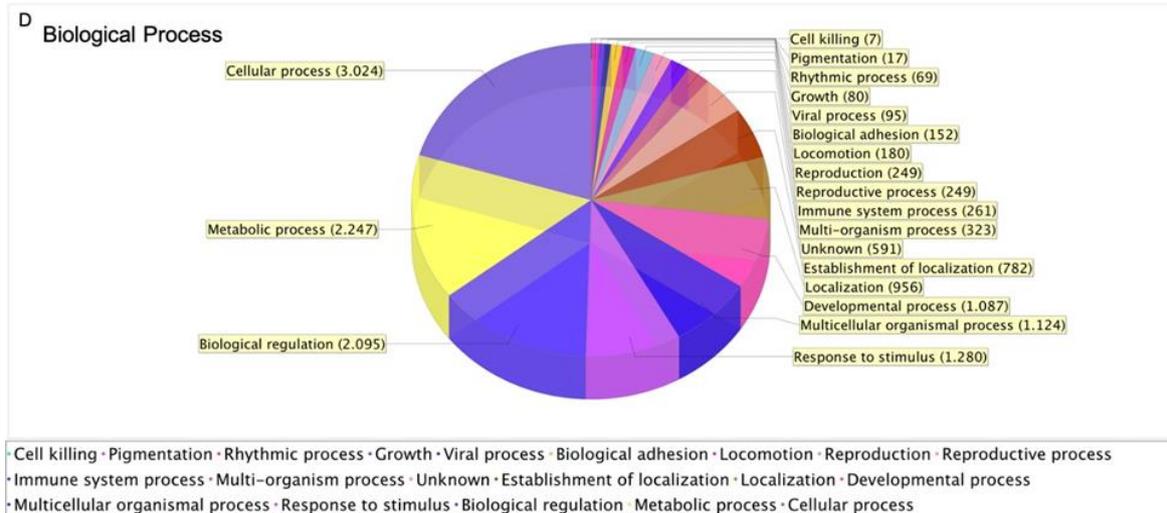

**Supplementary Figure S2.** Unbiased hierarchical clustering of in vivo gene expression profiles. Heat map of gene expression profiles shown with gene (row) to sample (column) clustering dendrograms. The colour corresponds to the square root of standardized TPM values scaled by the standard deviation and centred to the mean.

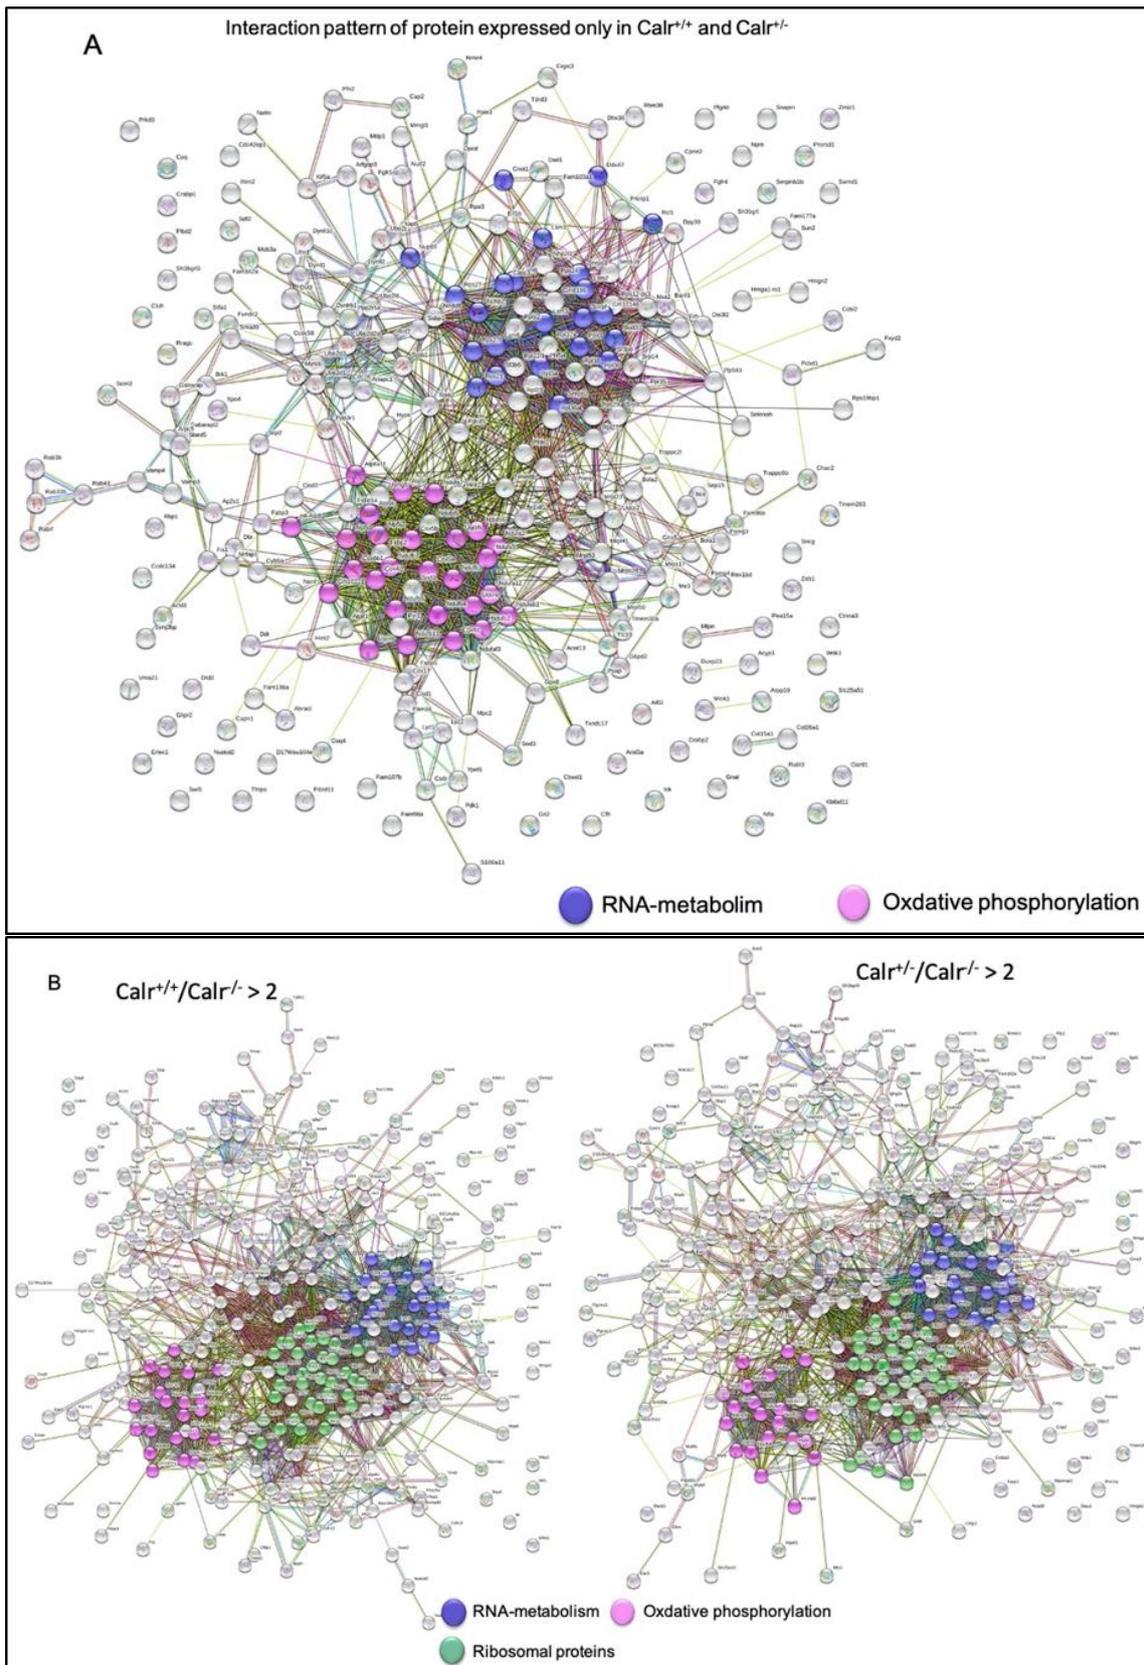

**Supplementary Figure S3.** 2-DE based comparative proteome analysis of the embryonic kidney from Calr<sup>+/+</sup> and Calr<sup>+/-</sup>. (A) Overlapping 2-DE map of Calr<sup>+/+</sup> and Calr<sup>+/-</sup> embryonic kidney proteomes. Blue spots indicate higher expression in Calr<sup>+/+</sup> vs. Calr<sup>+/-</sup> embryonic kidney. Orange spots indicate an up-regulation of the proteins in Calr<sup>+/-</sup> embryonic kidney. Protein expressed in both phenotypes are overlapping spots and are shown in black. (B) Magnified images of the regions of interest showing differentially regulated proteins in the Calr<sup>+/-</sup> embryonic mouse kidney. The protein expression quantification for selected proteins is given in form of bar diagrams. Results are given as the means  $\pm$  SD of the percentage volume of spot from at least three independent experiments ( $p < 0.05$ ). (C) Interaction network of the protein found to be differentially expressed between the Calr<sup>+/+</sup> and Calr<sup>+/-</sup> embryonic kidneys.

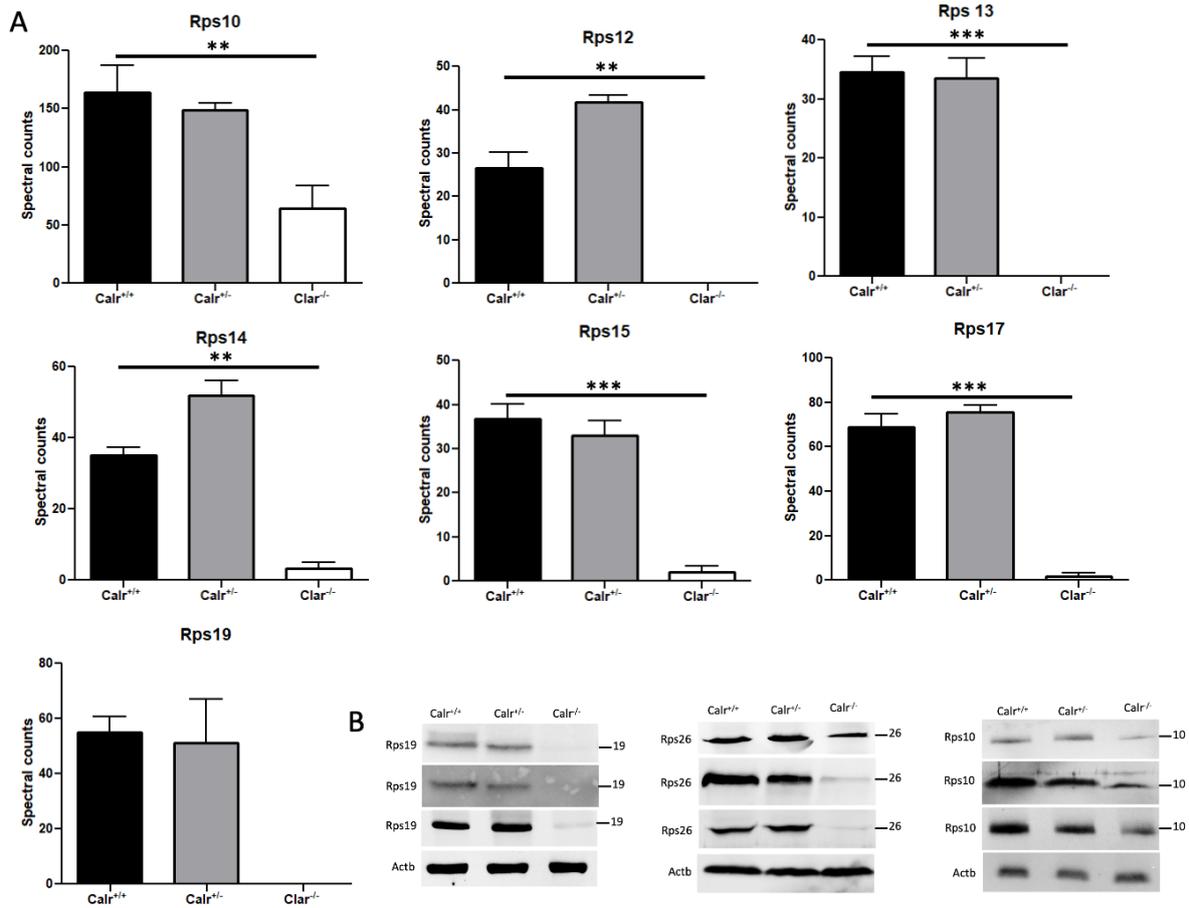

**Supplementary Figure S4.** (A–C) Volcano plot analysis of the identified and quantified proteins allowed the identification of proteins, which were differentially expressed between  $Calr^{+/+}$  and  $Calr^{-/-}$  (A),  $Calr^{+/-}$  and  $Calr^{-/-}$  (B), and  $Calr^{+/+}$  and  $Calr^{+/-}$  (C). (D) GO classification of the comparative proteome data. The categorization was achieved by correlating GO identification numbers corresponding to the biological process with the regulated proteins.

**Supplementary Figure S5.** String analysis of the comparative proteome data. **(A)** Protein interaction networks between the proteins found to only be expressed in  $Calr^{+/+}$  and  $Calr^{+/-}$  but not in  $Calr^{-/-}$ . **(B)** Protein interaction networks between the proteins found to be up-regulated in  $Calr^{+/+}$  and  $Calr^{+/-}$  compared to  $Calr^{-/-}$  mouse kidneys. The networks were generated using the protein networks software string (<https://string-db.org>).

**Supplementary Figure S6.** (A) MS quantification of ribosomal proteins found to be altered in *Calr*<sup>-/-</sup> embryonic kidney. The embryos were derived from at least three different pregnant *Calr*<sup>+/-</sup> mice. Kidneys from the same genetical background were grouped together. Protein extracts were prepared from embryonic kidneys from the three genotypes (*Calr*<sup>+/+</sup>, *Calr*<sup>+/-</sup>, and *Calr*<sup>-/-</sup>) and subjected to tryptic digest before mass spectrometric analysis. The protein expression quantifications for selected ribosomal proteins are given in the form of bar diagrams. Results are given as the means  $\pm$  SD of the spectral counts ( $p < 0.05$ ). (B) Western blot replicate for the ribosomal protein Rps10, Rps19, and Rps26. Protein extracts from embryonic kidney from the three genotype (*Calr*<sup>+/+</sup>, *Calr*<sup>+/-</sup>, *Calr*<sup>-/-</sup>) were separated on SDS-PAGE and the blots were investigated with the antibodies against the corresponding proteins.
