<b>L6</b>	90.4	9.6	4.6

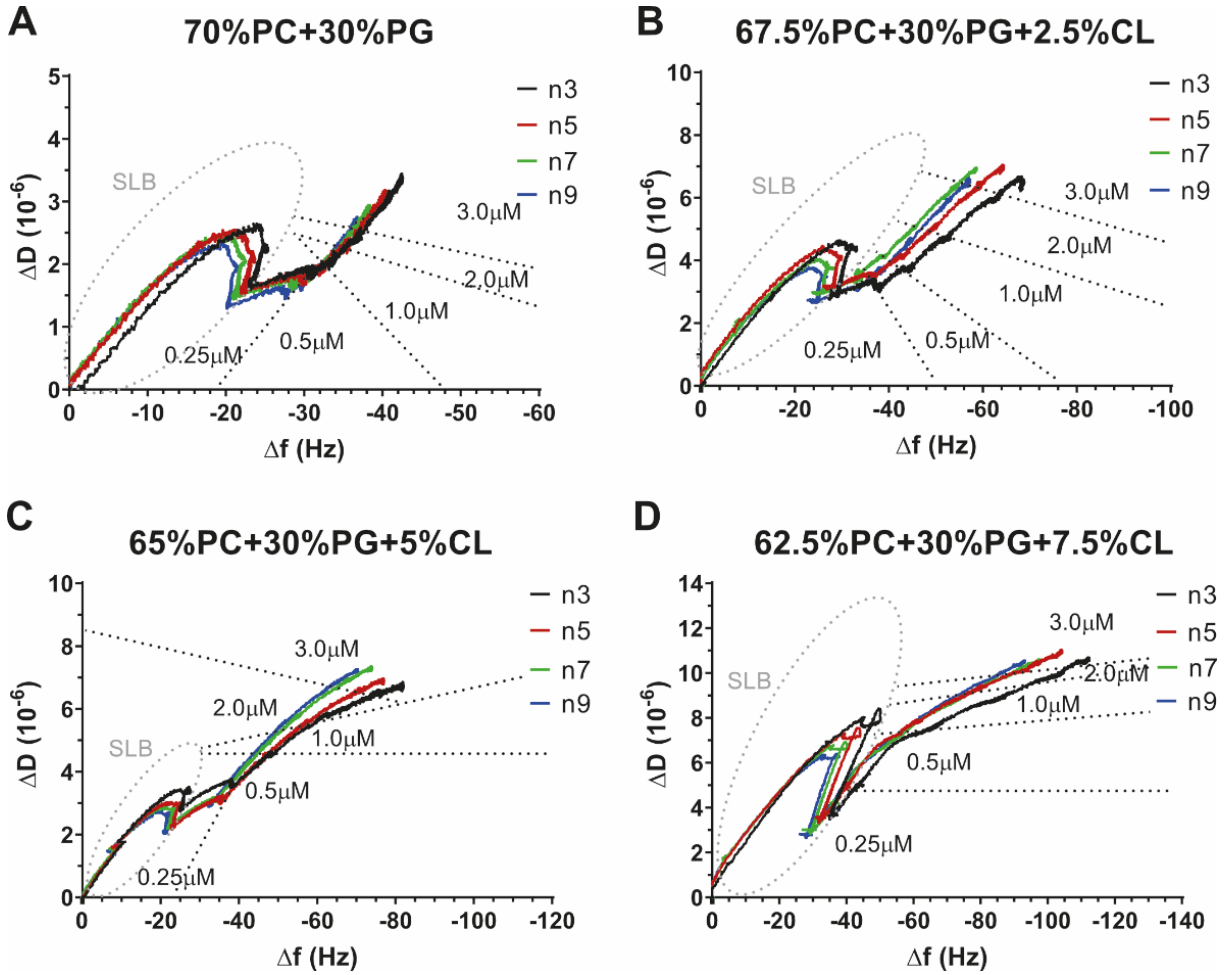

**Fig. S1 Comparison of DivIVA<sub>Bs</sub> and DivIVA<sub>Cd</sub> primary structures and secondary structure and coiled-coils predictions**

A. Secondary structure prediction and alignment of DivIVA<sub>Cd</sub> and DivIVA<sub>Bs</sub>. DivIVA<sub>Cd</sub> and DivIVA<sub>Bs</sub> share 46.6% similarity and 31.1% identity. The residues, which are important for DivIVA<sub>Bs</sub> binding to the membrane and corresponding residues in DivIVA<sub>Cd</sub> are in green rectangle, identical residues are in red font.

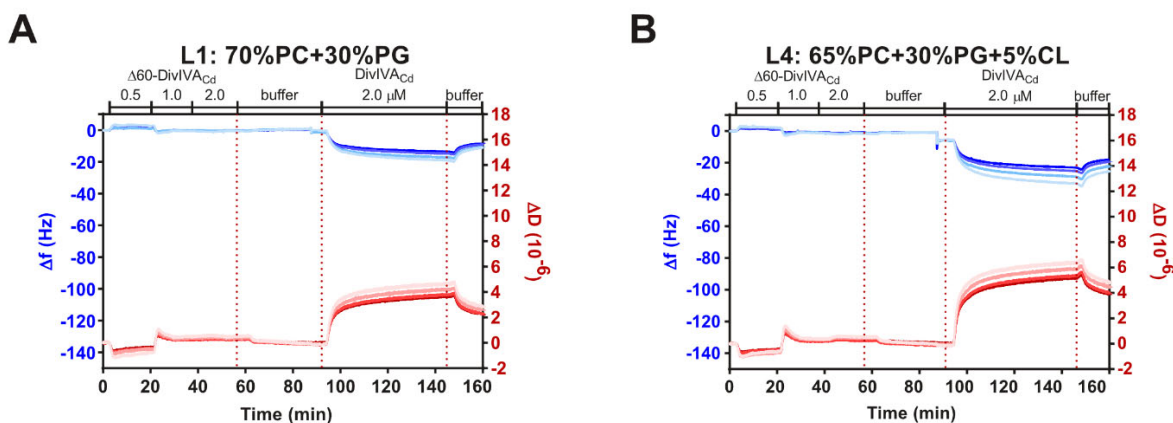

B. Coiled-coil predictions. Green line corresponds to window of 14, blue line to window of 21, and red line to window of 28 residues. Predicted in COILS version 2.2 [5,6].

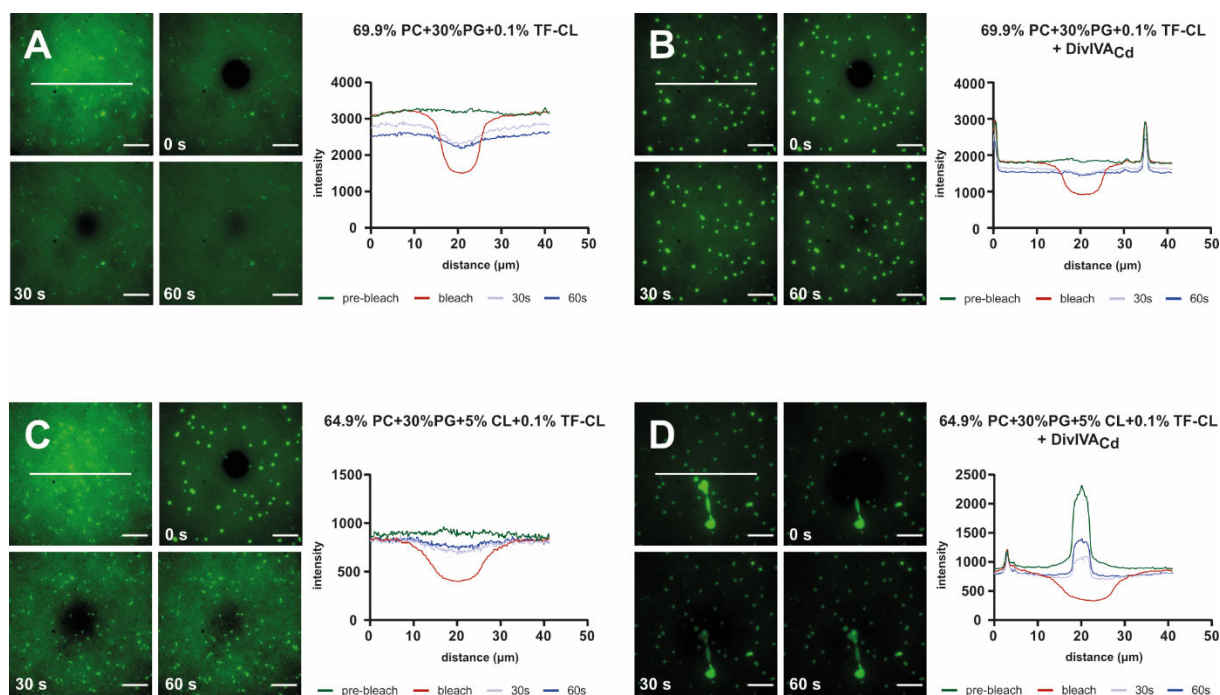

**Fig. S2 Dynamic analysis of DivIVA<sub>Cd</sub> lipid binding to SLB**

A-D. Plots of  $\Delta f$  against  $\Delta D$  indicate that DivIVA<sub>Cd</sub> binding changes the morphology of the lipid bilayer. Representative measurements of the third (in black), fifth (in red), seventh (in green) and ninth (in blue) overtones as offset to zero after obtaining the baseline prior SLB formation are shown. The SLB formation is depicted in grey dashed oval, the plot is divided to areas corresponding to particular concentrations of DivIVA<sub>Cd</sub> by black dashed lines. The x-axis is reversed thus ascending curve indicates increased mass absorption. In the presence of cardiolipin and DivIVA<sub>Cd</sub> the curves are not overlapping, which means soft biofilm is formed.

**Fig. S3 QCM-D with N-terminally truncated DivIVAC<sub>d</sub>**

The plots show details of  $\Delta f$  (in blue) and  $\Delta D$  (in red) of the third, fifth, seventh and ninth overtone (lower overtones are in lighter tone, highest overtone is darkest), which were normalized to baseline obtained after SLB formation. As indicated above the plots, QCM-D measurements obtained after addition of 0.5  $\mu\text{M}$   $\Delta 60\text{-DivIVAC}_d$ , 1.0  $\mu\text{M}$   $\Delta 60\text{-DivIVAC}_d$ , and 2.0  $\mu\text{M}$   $\Delta 60\text{-DivIVAC}_d$  to SLBs mixtures (A) L1 (70% PC and 30% PG) and (B) L4 (65% PC, 30% PG and 5% CL) are shown. As a positive control, in both experiments, after an extensive buffer wash (marked by the first two red dashed lines), we injected 2  $\mu\text{M}$  full-length DivIVAC<sub>d</sub> and we observed similar  $\Delta f$  response as in previous experiments with 2  $\mu\text{M}$  DivIVAC<sub>d</sub> and L1 or L4 lipid mixture. The third dashed red line marks the final buffer rinse. While full-length DivIVAC<sub>d</sub> produced a response similar to that seen previously under the same conditions, the  $\Delta 60\text{-DivIVAC}_d$  protein did not bind to either of the tested SLBs.

**Fig. S4 FRAP revealed that lipid mobility is preserved in SLBs**

SLBs composed of (A, B) 69.9% PC, 30% PG and 0.1% TF-CL (L1\*) and (C, D) 64.9% PC, 30% PG+5% CL and 0.1% TF-CL (L4\*) were subjected to FRAP analysis both before and after the addition of 2 μM DivIVA<sub>Cd</sub>. Representative images are shown with 10 μm scale bars. The plots represent fluorescence intensities before bleaching (green line), bleaching (red line), and 30 s and 60 s after bleaching (blue lines) measured along the white line shown in the upper left panel. The recovery within bleached areas indicate that the lipids remained dynamic within the SLBs even after DivIVA<sub>Cd</sub> addition and cluster formation.

**Fig. S5 Structures of fluorescent derivatives of CL and PE used in the study**

(A) TopFluor® Cardiolipin: 1,1',2,2'-tetraoleoyl cardiolipin[4-(dipyrrrometheneboron difluoride)butanoyl];

(B) 18:1 Liss Rhod PE: 1,2-dioleoyl-sn-glycero-3-phosphoethanolamine-N-(lissamine rhodamine B sulfonyl). Source: avantilipids.com
