

(A) Epididymal ADSCs

(B) Inguinal ADSCs

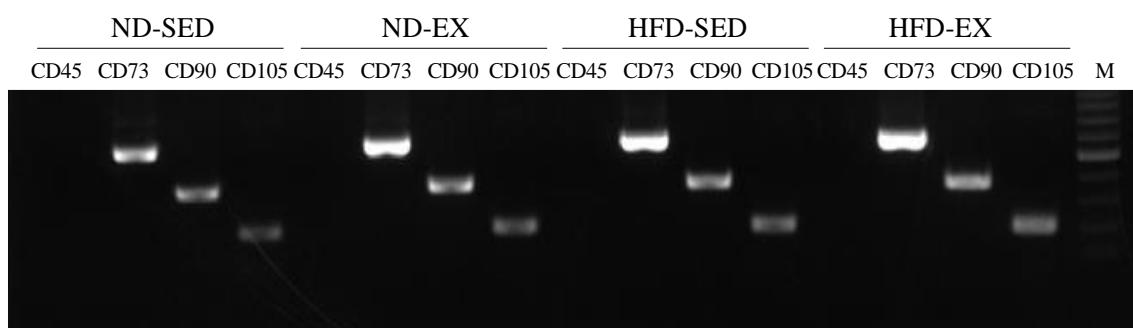

Figure S1. The expression levels of ADSCs markers. Reverse transcription-polymerase chain reaction (RT-PCR) was performed by using RNA extracted from ADSCs. CD45 used as a negative marker. CD73, CD90, and CD105 were used as positive markers for the analysis of ADSCs. **A.** Epididymal ADSCs. **B.** Inguinal ADSCs.

Table S1. Relative ratio of metabolites in epididymal ADSC-derived adipocytes.

Compound name	Comparative Analysis

N.A.: Not available. Although it was a target for calculation, it could not be calculated due to lack of data. The ratio of the detected mean values between the two groups was calculated with the latter as the denominator. Welch's t-test *p*-value and its range are shown. (**p*<0.05, ***p*<0.01, ****p*<0.001)
