

**Table S1.** Ability to form biofilm assessed by Crystal Violet (CV) and Richard's (RM) methods of methicillin-susceptible (MSSA) and methicillin-resistant (MRSA) *Staphylococcus aureus* strains cultivated in three media: tryptic soy broth TSB, tryptic soy broth with 1% glucose TSB+G and Dulbecco's Modified Eagle Medium DMEM expressed as an average values of absorbance measured at 550 nm (CV) and 490 nm (RM) wavelength and standard deviations in brackets.

Method	Strain	Absorbance		
		TSB	TSB+G	DMEM
CV	ALL	2,96 (0,58)	3,73 (1,27)	1,69 (0,20)
	MSSA	3,33 (0,49)	4,26 (1,03)	1,64 (0,22)
	MRSA	2,58 (0,37)	3,20 (1,26)	1,73 (0,18)
RM	ALL	2,56 (0,56)	1,80 (0,79)	0,74 (0,30)
	MSSA	2,92 (0,51)	2,12 (0,53)	0,84 (0,35)
	MRSA	2,21 (0,33)	1,49 (0,87)	0,64 (0,19)

**Figure S1.** Scatter plots of correlations between the ability to form biofilm assessed with the Crystal Violet method (CV) and bacterial metabolic activity measured with the Richard's method (RM) for methicillin-susceptible *Staphylococcus aureus* MSSA and methicillin-resistant *Staphylococcus aureus* MRSA strains cultured in tryptic soy broth TSB (a), tryptic soy broth with 1% glucose TSB+G (b) and Dulbecco's Modified Eagle Medium DMEM (c).

**Table S2.** Zones of inhibitions of gentamycin GENTA, ciprofloxacin CIPRO, levofloxacin LEVO obtained by disk-diffusion method, and minimal inhibitory concentrations of vancomycin VANCO obtained by a strip diffusion method for methicillin-susceptible (S1-S5, ATCC 6538) and methicillin-resistant *Staphylococcus aureus* strains (R1-R5, ATCC 33591). Results were interpreted following European Committee on Antimicrobial Susceptibility Testing breaking points table. S – susceptible, I – susceptible, increased exposure, R – resistant; ATCC – American Type Culture Collection.

Agar diffusion method	Zones of inhibition [mm]						MIC [mg/L]	
	STRAIN	GENTA	CIPRO	LEVO	VANCO			
	S1	30 S	32 I	31 I	0.5 S			
	S2	28 S	33 I	35 I	0.5 S			
	S3	27 S	32 I	33 I	1 S
