

Figure S1: Proliferation of spermatogonia co-cultured in contact with feeders is higher than proliferation of spermatogonia co-cultured with feeders with physical separation using transwell inserts. Percent of UCH-L1 (+) spermatogonia from 1- week-old pigs that are also EdU (+), in co-culture conditions at 1 week of culture, using PMC, PFF, and Sertoli cell feeders. n = 3, mean \pm SD. ** $p \leq 0.01$.

Table S3: Transwell Experiment Conditions.

Condition	Description
Contact (C)	Spermatogonia seeded directly on top of feeders
Transwell (TW)	Feeders placed on the bottom of wells, and spermatogonia in the transwell inserts
Co-culture- conditioned media (CCCM)	Feeder-free culture using conditioned

	media from co-cultures
Feeder- conditioned media (FCM)	Feeder-free culture using conditioned media from feeders
Spermatogonia on Co-cultures (Spermatogonia on CC)	Spermatogonia and feeders placed on the bottom of wells, and a second group of spermatogonia placed in the transwell inserts (1.0×10^5 spermatogonia in the insert and 1.0×10^5 spermatogonia in contact with the feeder cells)
Spermatogonia in transwells (SG in TW)	Spermatogonia cultured feeder-free in the transwell inserts in unconditioned α -MEM with additives
Spermatogonia under transwells (SG under TW)	Spermatogonia cultured feeder-free in unconditioned α -MEM with additives in the bottom of the well, with an empty transwell insert above
