

Figure S1. Effect of treating M-HeLa cells with siRNA on EGFR expression in the host cell. Expression levels of EGFR in treating M-HeLa cells with siRNA targeting EGFR were determined using real-time RT-PCR. Control - M-HeLa cells transfected with siRNA containing scrambled nucleotide sequence. The insert shows the total amount of EGFR and internal control GAPDH in untreated M-HeLa cells and pretreating cells with small interfering RNA at the according to the manufacturer's protocol. Values are expressed as mean \pm S.D. (error bars). A difference was considered significant at the $p < 0,05$ level.
