

SUPPLEMENTARY CONTENTS

Figure S1A. Flow diagram showing the selection of patients, categorization of pattern of biomarker change, and inclusion in analyses for CEA in LIPSYT / TAUH / TUH cohorts.....	2
Figure S1B. Flow diagram showing the selection of patients, categorization of pattern of biomarker change, and inclusion in analyses for CA19-9, CRP, YKL-40, IL-6 in the LIPSYT cohort.....	3
Figure S2. CEA dynamics within reference range during adjuvant therapy per patient in the LIPSYT data	4
Figure S3. Disease-free survival (DFS) (LIPSYT study panel A. TAUH panel C) and overall survival (OS) (LIPSYT study panel B and TAUH cohort panel D) according to CA19-9 kinetics during adjuvant therapy	5
Figure S4. Disease-free survival (DFS) (LIPSYT study panel A. TAUH panel C) and overall survival (OS) (LIPSYT study panel B and TAUH cohort panel D) according to CRP kinetics during adjuvant therapy	6
Figure S5. Disease-free survival (DFS) (panel A) and overall survival (OS) (panel B) according to YKL-40 kinetics during adjuvant therapy	7
Figure S6. Disease-free survival (DFS) (panel A) and overall survival (OS) (panel B) according to IL-6 kinetics during adjuvant therapy	8
Table S1. Patient demographics according to CEA dynamics group. Statistically significant results are presented in red	9
Table S2. Associations of “Transient increase”, “No increase” and “Persistent increase” of CEA with haematological and biochemical parameters, and treatment-related adverse events.....	10

^a CEA was not routinely measured in the early inclusion period in any of the cohorts.

^b The 10% cut-off was chosen, because a >10% change was greater than the intra-assay and inter-assay coefficient of variation (CV) of the biomarkers evaluated, and the 10% cut-off does not depend on the biomarker reference range

^a CA19-9 was not routinely measured in the early inclusion period in the LIPSYT-study

^b The 10% cut-off was chosen, because a >10% change was greater than the intra-assay and inter-assay coefficient of variation (CV) of the biomarkers evaluated, and the 10% cut-off does not depend on the biomarker reference range

Figure S1. A. Flow diagram showing the selection of patients, categorization of pattern of biomarker change, and inclusion in analyses for CEA in LIPSYT / TAUH / TUH cohorts. B. Flow diagram showing the selection of patients, categorization of pattern of biomarker change, and inclusion in analyses for CA19-9, CRP, YKL-40, IL-6 in the LIPSYT cohort.

Figure S2. CEA dynamics within reference range during adjuvant therapy per patient in the LIPSYT data.

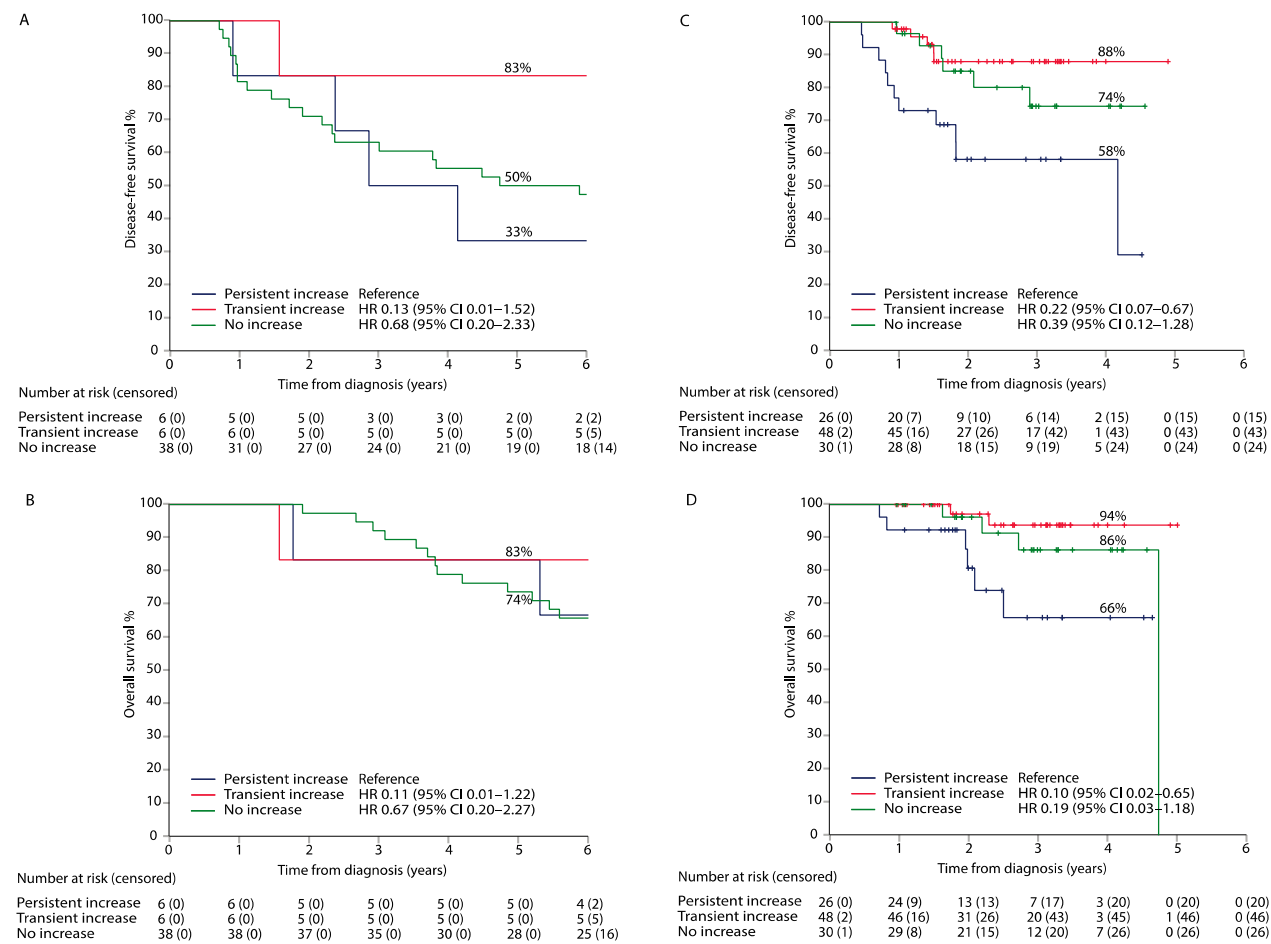

Figure S3. Disease-free survival (DFS) (LIPSYT study panel A. TAUH panel C) and overall survival (OS) (LIPSYT study panel B and TAUH cohort panel D) according to CA19-9 kinetics during adjuvant therapy.

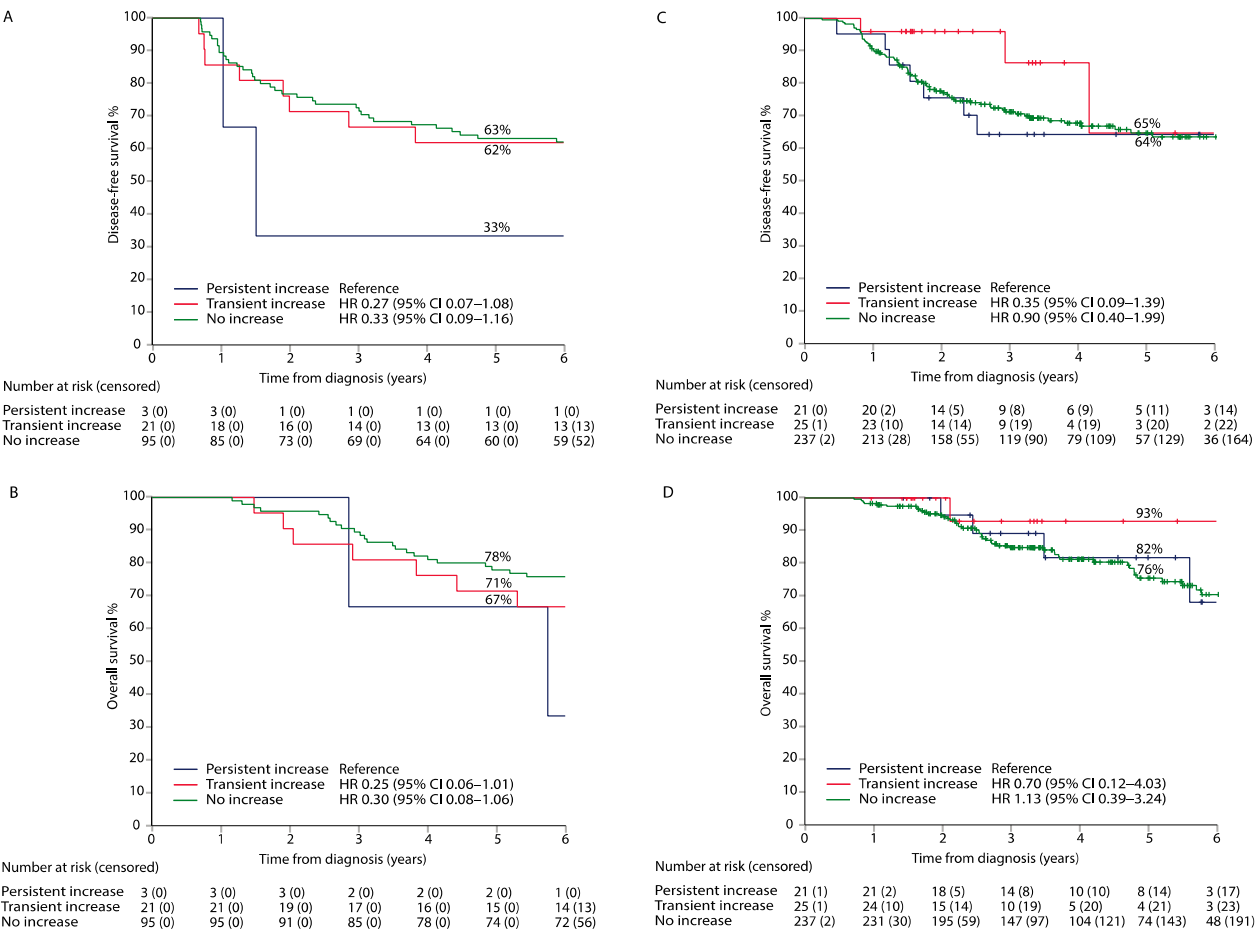

Figure S4. Disease-free survival (DFS) (LIPSYT study panel A. TAUH panel C) and overall survival (OS) (LIPSYT study panel B and TAUH cohort panel D) according to CRP kinetics during adjuvant therapy.

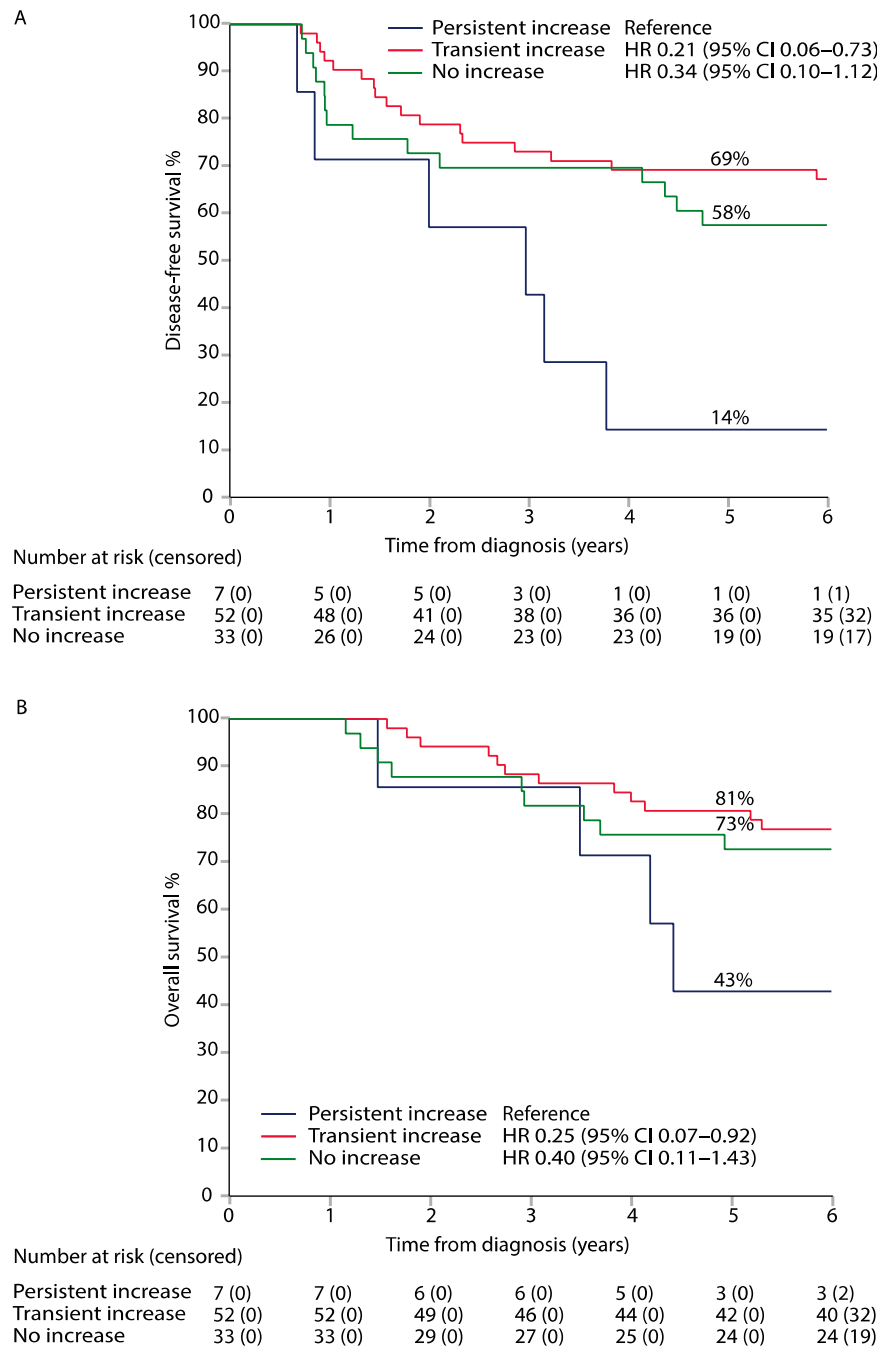

Figure S5. Disease-free survival (DFS) (panel A) and overall survival (OS) (panel B) according to YKL-40 kinetics during adjuvant therapy.

Figure S6. Disease-free survival (DFS) (panel A) and overall survival (OS) (panel B) according to IL-6 kinetics during adjuvant therapy.

Table S1. Patient demographics according to CEA dynamics group. Statistically significant results are presented in red.
