Keywords: pyrazol, ligand.

The mixture of N,N-dimethyl-para-phenylenediamine 2 (136 mg, 10 mmol) and 1-hydroxy-methyl-3,5-dimethylpyrazol 1 (252 mg, 20 mmol) in CH$_3$CN (20 mL), was stirred at room temperature for five days[1, 2]. The organic layer was dried over Na$_2$SO$_4$, filtered and concentrated at reduced pressure. The residue was purified by recrystallisation in dichloromethane-diethylether to give product 3 as a black solid (300 mg, 85%).

Melting point: 88-90 °C (dichloromethane-diethylether: 1/1).
