

**Figure S1. Time dependence of the conventional metrics.**

Viability and aGR for different assay durations (3-days and 6-days) were compared for OV1369(R2) and OV1946 cells respectively. Detailed values of each metric evaluation are in Supplementary Table 1. Clearly 6-days assay displayed a lower viability in the most of concentration range, that is, a more sensitive response curve. For both viability- and aGR-dose-responses, the concentrations corresponding to the half maximal inhibition were lower in 6-days assay than in 3-days one.

**Table S1. Detail calculations in evaluation of the public data with each drug-response metric.**

Cell line	Conc. (uM)	Fold change		a. Viability	
		at day 3	at day 6	at day3	at day6
