

Supplemental Materials: Disease and health inequalities attributable to air pollutant exposure in Detroit, Michigan

Sheena E. Martenies ¹, Chad W. Milando ², Guy O. Williams ³ and Stuart A. Batterman ^{4,*}

Supplemental Tables:

Table S1. Pollutants, health outcomes, age groups, and concentration-response coefficients used in the health impact functions

Table S2. Disability weights, duration, and monetary values used to estimate disability-adjusted life years and monetized impacts

Table S3. Concentration index values ($\times 100$) for annual average exposure concentration attributable to individual ambient air pollutants for the full analysis and the two sensitivity analyses. Percentages in parentheses are the percent difference between the sensitivity analysis values and the “all blocks” analysis.

Supplemental Figures:

Figure S1. Maps of baseline health rates used in the health impact functions.

Figure S2. Maps of SES variables used to rank census blocks when calculating the concentration index. Figure S3. Comparison of the distributions of measured daily mean SO₂ concentrations at the Southwest High School monitor (2011–2015) and modeled FRESH-EST receptors within 150 m of the monitor. K-S tests for each receptor are all non-significant ($p > 0.05$)

Figure S4. Daily concentrations of NO₂ (daily mean, ppb), O₃, (daily 8-hour max, ppb), and PM_{2.5} (daily mean, $\mu\text{g}/\text{m}^3$) averaged across monitors in the Detroit, MI area.

Figure S5. Annual diesel particulate matter (DPM) concentrations (A, $\mu\text{g}/\text{m}^3$) and excess cancer risk (B, excess cases per 10⁶) due to DPM exposures measured at the census block level.

Figure S6. Maps showing the burden of disease (as DALYs per 10,000 per year) attributable to total exposures of (A) PM_{2.5}, (B) ozone, (C) SO₂, and (D) NO₂. The sub-region of the study area that is in non-attainment of the SO₂ National Ambient Air Quality Standard is shown (blue polygon).

Figure S7. Correlations between block-level demographic and socioeconomic variables in the study area

Supplemental Tables

Supplemental Figures

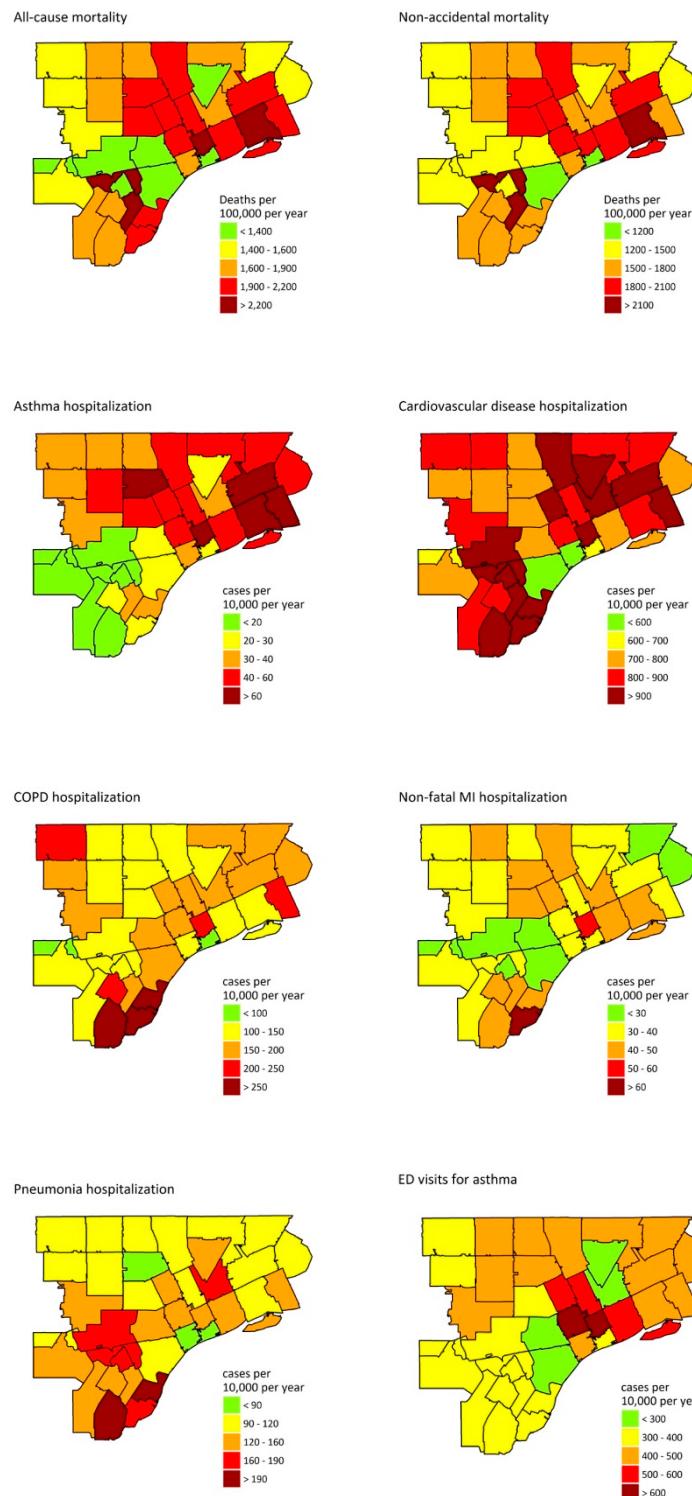

Figure S1. Maps of baseline health rates used in the health impact functions.

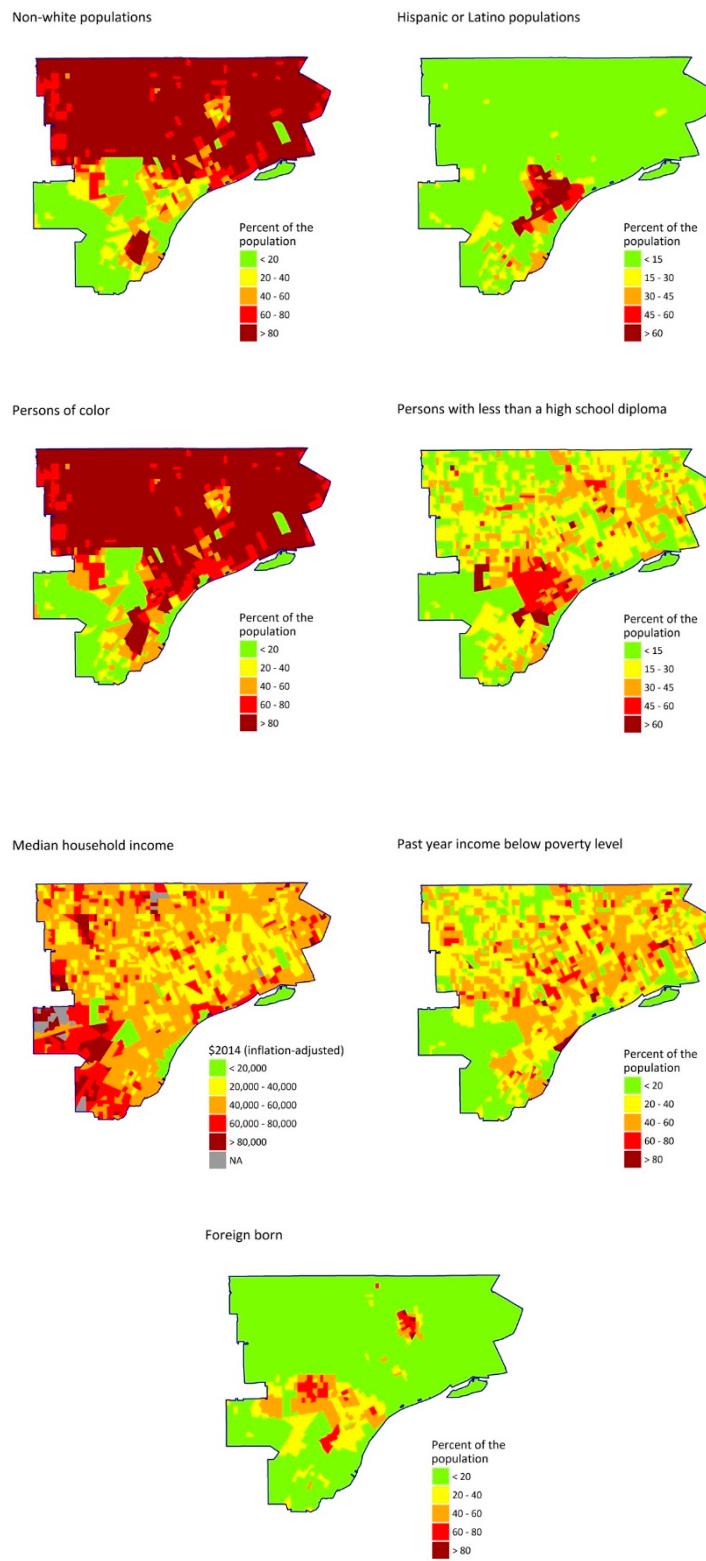

Figure S2. Maps of SES variables used to rank census blocks when calculating the concentration index.

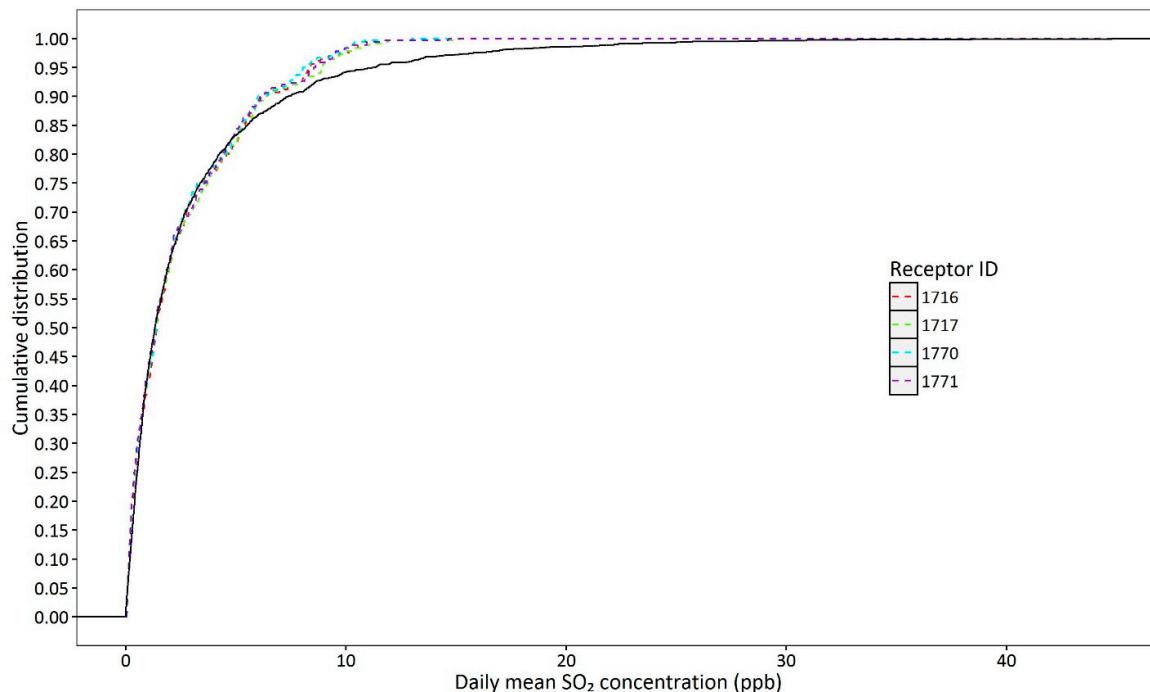

Figure S3. Comparison of the distributions of measured daily mean SO_2 concentrations at the Southwest High School monitor (2011–2015) and modeled FRESH-EST receptors within 150 m of the monitor. K-S tests for each receptor are all non-significant ($p > 0.05$)

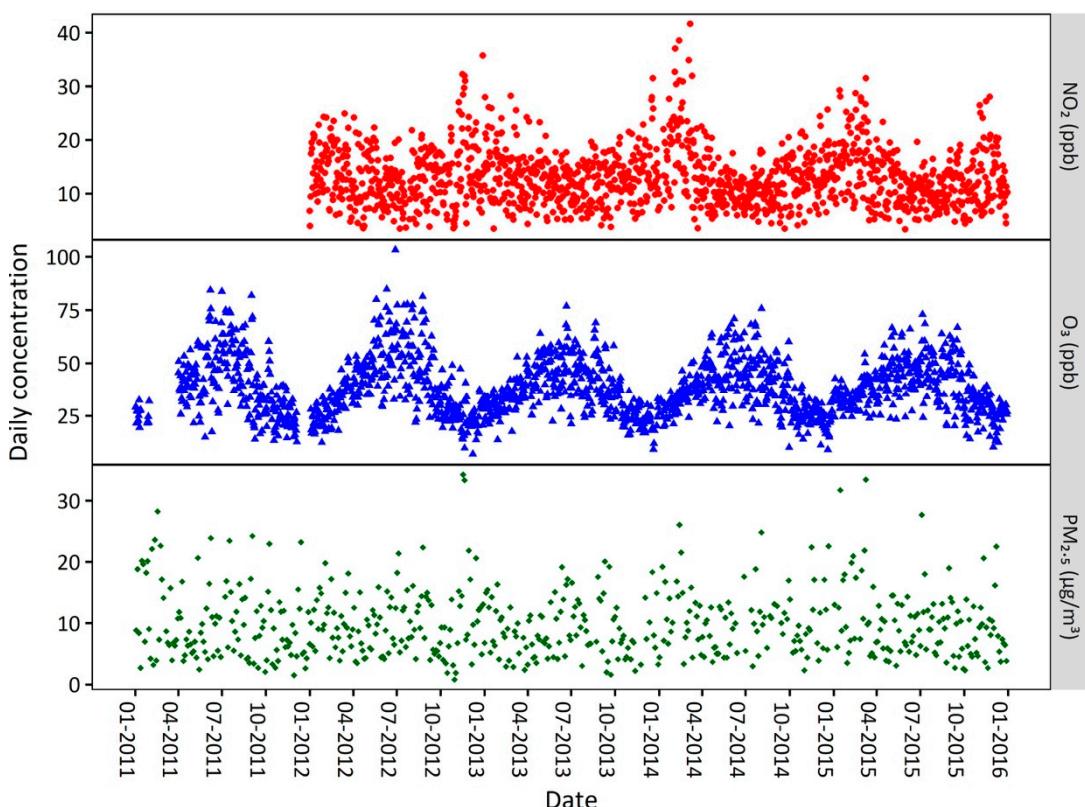

Figure S4. Daily concentrations of NO_2 (daily mean, ppb), O_3 (daily 8-hour max, ppb), and $\text{PM}_{2.5}$ (daily mean, $\mu\text{g}/\text{m}^3$) averaged across monitors in the Detroit, MI area.

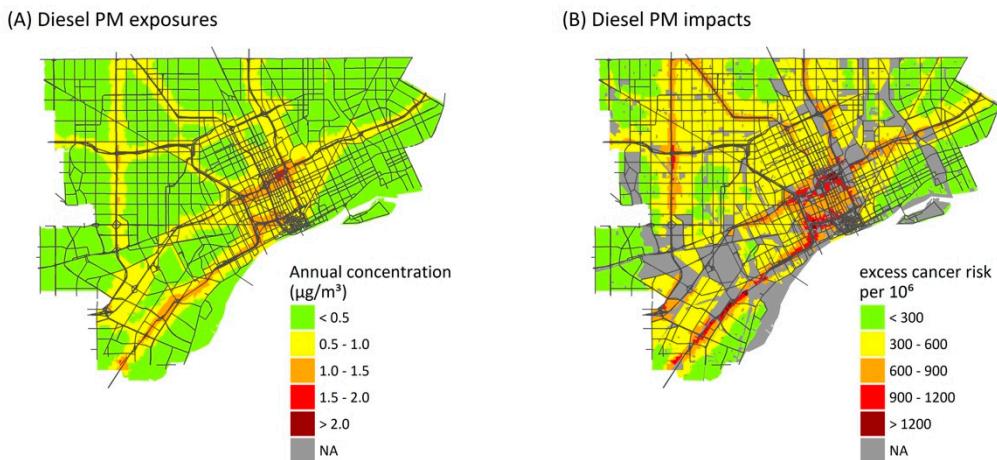

Figure S5. Annual diesel particulate matter (DPM) concentrations (A, $\mu\text{g}/\text{m}^3$) and excess cancer risk (B, excess cases per 10^6) due to DPM exposures measured at the census block level.

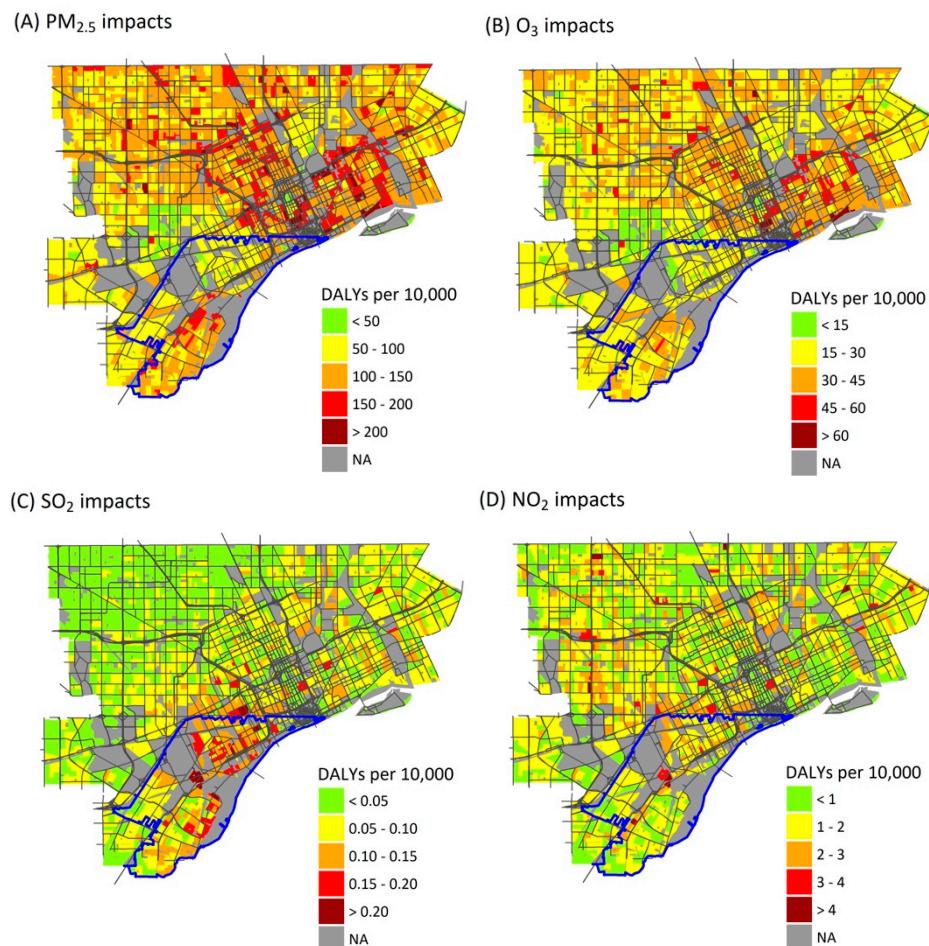

Figure S6. Maps showing the burden of disease (as DALYs per 10,000 per year) attributable to total exposures of (A) PM_{2.5}, (B) ozone, (C) SO₂, and (D) NO₂. The sub-region of the study area that is in non-attainment of the SO₂ National Ambient Air Quality Standard is shown (blue polygon).

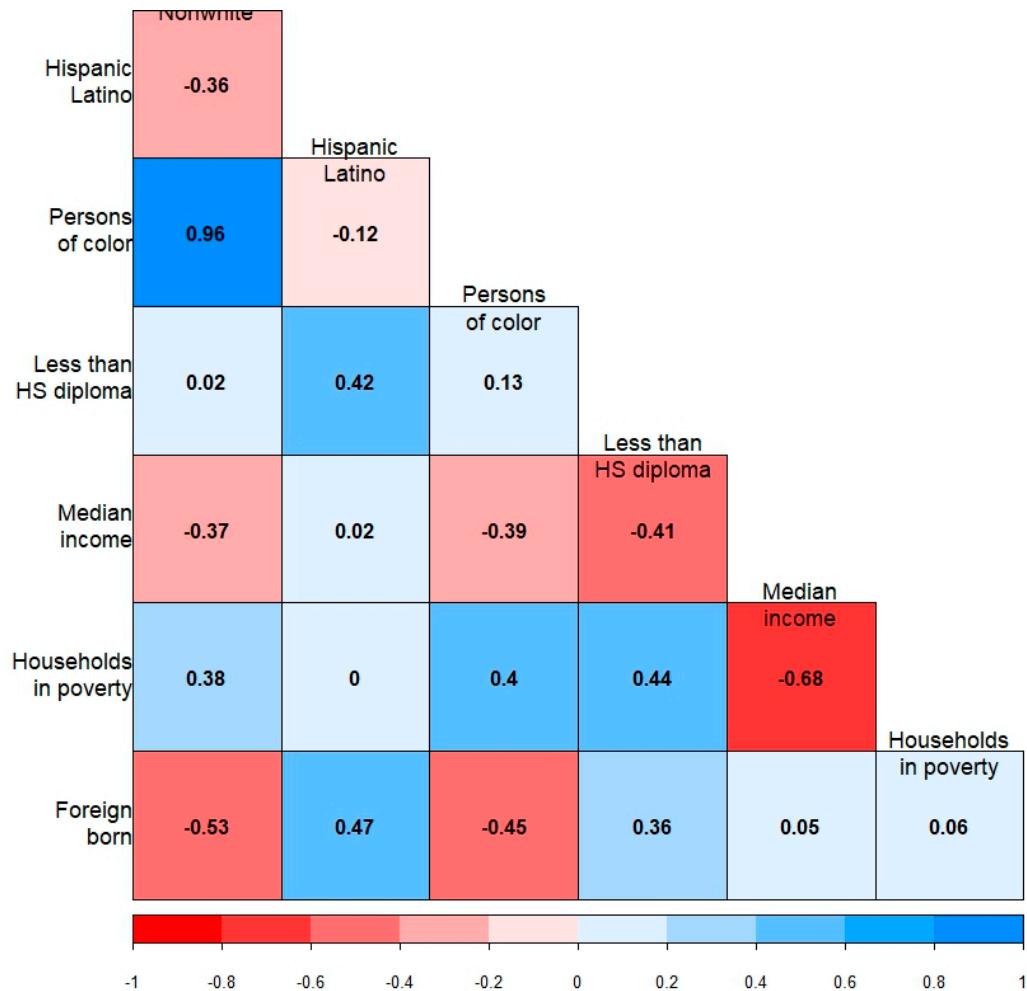

Figure S7. Correlations between block-level demographic and socioeconomic variables in the study area
