Reproduction in the controls

a)

b)

Figure S1: Reproduction in the controls with 40%, 50% and 60% maximum water holding capacity (WHC). *F. candida* reproduction in the control treatments with different water contents in two independent repetitions (a, b) in OECD soil (see Figure 4 for third repeat). Shown is the mean number of juveniles after a 28-day reproduction test. Asterisks indicate significant statistical differences between the respective controls (Kruskal-Wallis, post-hoc Dunn test, $p > 0.05$). Mean \pm SE, $n = 8$.
