## 1. MEA Testing protocol

### 1.1 Hydration and cell break-in

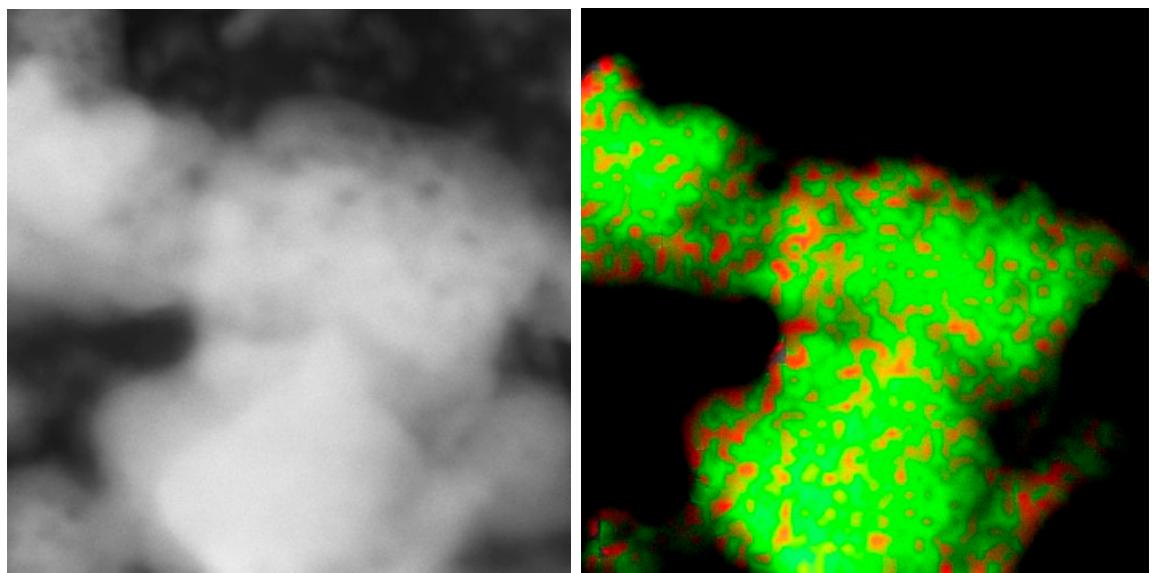

All MEAs were initially heated to 80 °C held at 0.6 V for at least 6 hrs and up until a constant current was observed under a cathode/anode gas supply of air/H<sub>2</sub> respectively. The cathode/anode relative humidity (RH), stoichiometric coefficient and absolute pressure was 100 %/100 %, 1.5/1.3 and 1.3 bar/1.5 bar respectively. The required conditions for the polarisation curve were then set as detailed in the experimental section of the main report before running the following break in procedure: The current was held at 11.2 A for 5 minutes before holding the potential at 0.8 V for 5 mins, 0.4 V for 5 mins, 0.8 V for 5 mins, 0.6 V for 5 mins, 0.8 V for 5 mins and then 11.2 A for 35 mins, ensuring stability of the recorded voltage.

### 1.2 Polarisation curve acquisition

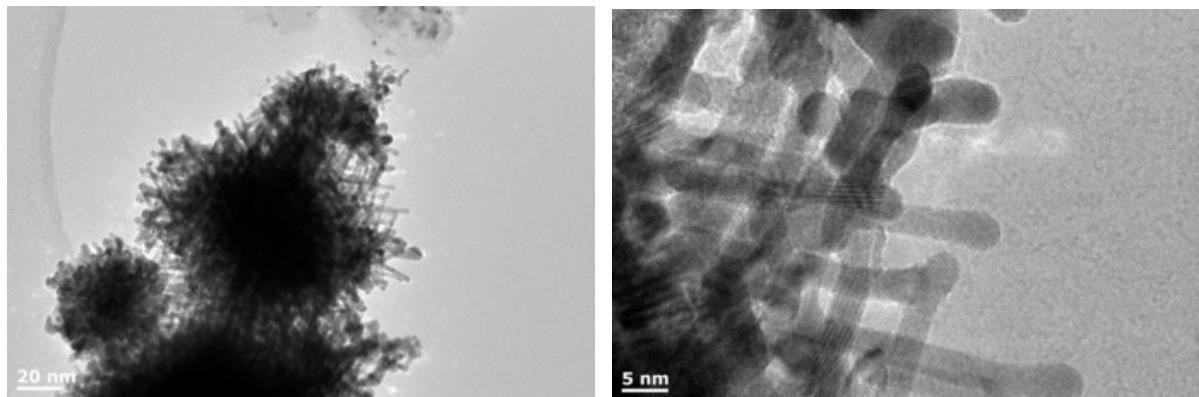

Polarisation curves were obtained using the procedure detailed in Appendix E of the harmonised protocols [1].
