Supplementary Methods

Determination of photothermal conversion efficiency

The photothermal conversion efficiency (η) of the prepared nanoparticles (NPs) was calculated by using the following equation

$$\eta = \frac{hS(T_{\max} - T_{\text{surr}}) - Q_{\text{dis}}}{I(1 - 10^{-A_{808\text{nm}}})} \quad (1)$$

where h is the heat transfer coefficient; S is the irradiated area; I is the laser power density (0.9 W cm^{-2}); $A_{808\text{nm}}$ is the absorbance at 808 nm; T_{\max} and T_{surr} are the maximum temperature and the surrounding temperature; Q_{dis} is the baseline energy input from the light absorption by the solvent. In Equation (1), hS value is calculated using the following equations:

$$hS = \frac{mC_p}{\tau_s} \quad (2)$$

$$t = -\tau_s \ln \theta \quad (3)$$

$$\theta = \frac{T - T_{\text{surr}}}{T_{\max} - T_{\text{surr}}} \quad (4)$$

m and C_p are the mass (1.0 g) and the thermal capacity, respectively; T is the temperature at the cooling time (t). By linear fitting cooling time (t) to negative natural logarithm of temperature ($-\ln\theta$), τ_s was determined to be 329.83, 322.80 and 326.68 s for PdPt NPs, PdPt@HA and DOX@PdPt@HA NPs, respectively (Figure S1).

The value of Q_{dis} of water was calculated to be 30.54 mW using the following equation:

$$Q_{\text{dis}} = h_0 S (T_{\text{max, water}} - T_{\text{surr, water}}) \quad (5)$$

Thus, η of PdPt NPs, PdPt@HA and DOX@PdPt@HA NPs was calculated to be 48.6%, 49.8% and 49.1%, respectively.

Supplementary Results

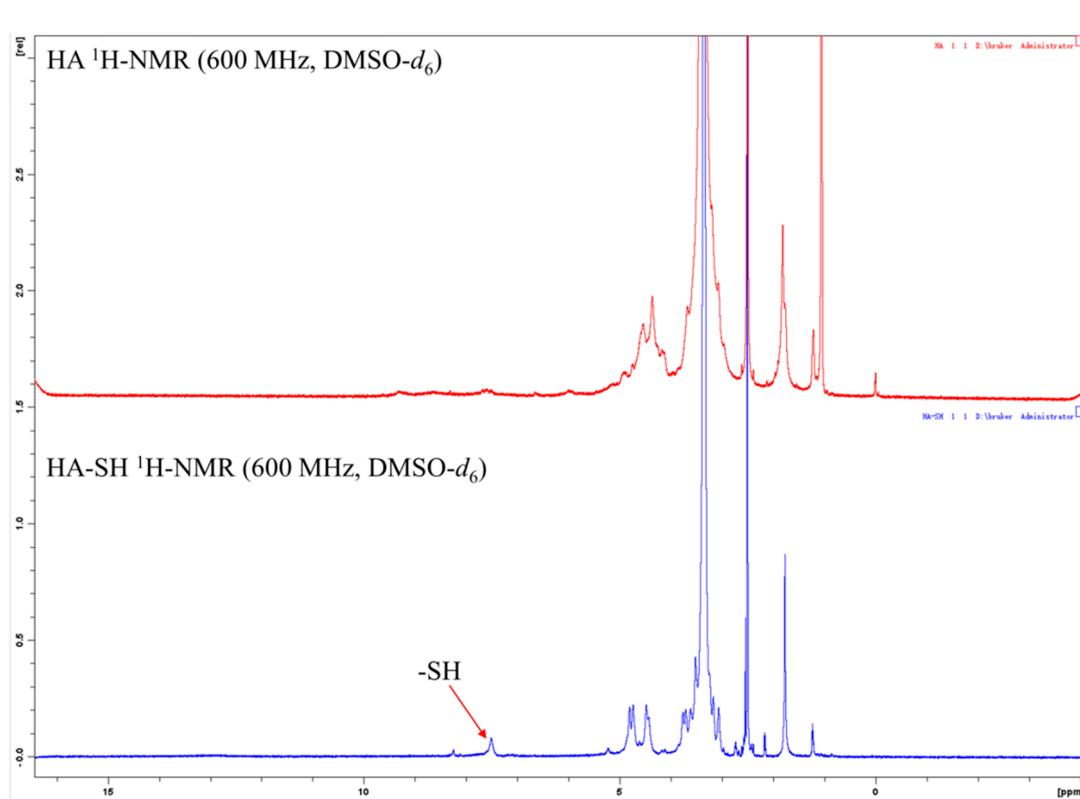

Figure S1. Proton nuclear magnetic resonance ($^1\text{H-NMR}$) spectrum of hyaluronic acid (top) and synthesized thiol functionalized hyaluronic acid (bottom).

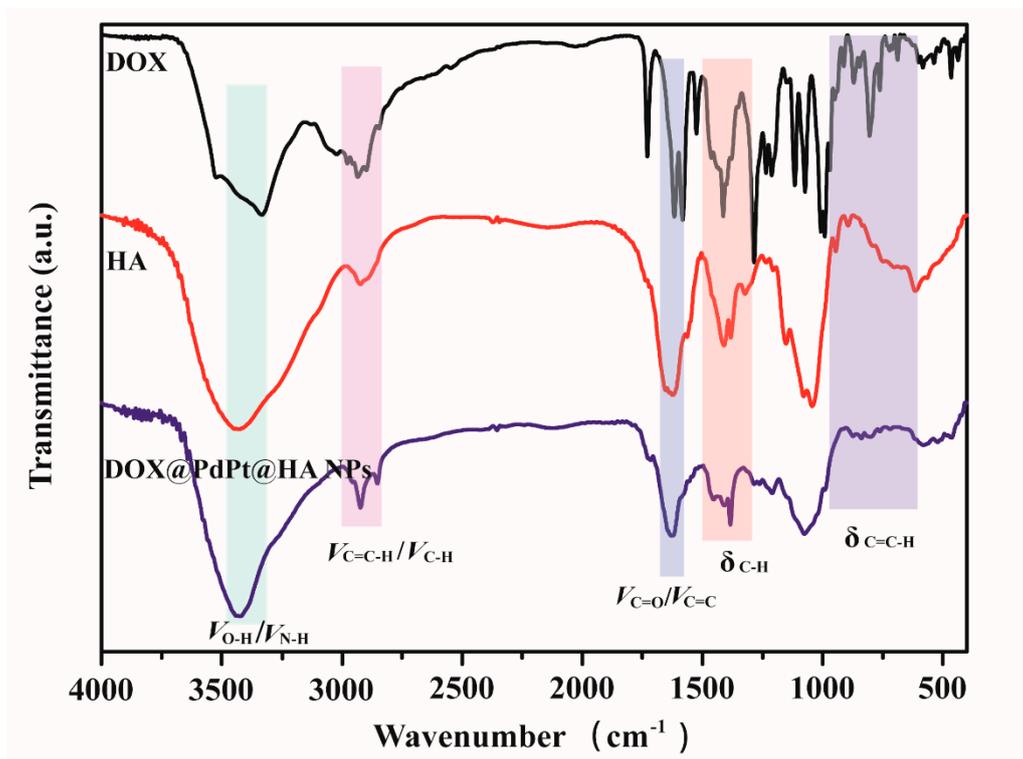

Figure S2. Fourier transform infrared (FTIR) spectra of hyaluronic acid (HA), doxorubicin (DOX), and DOX@PdPt@HA NPs.

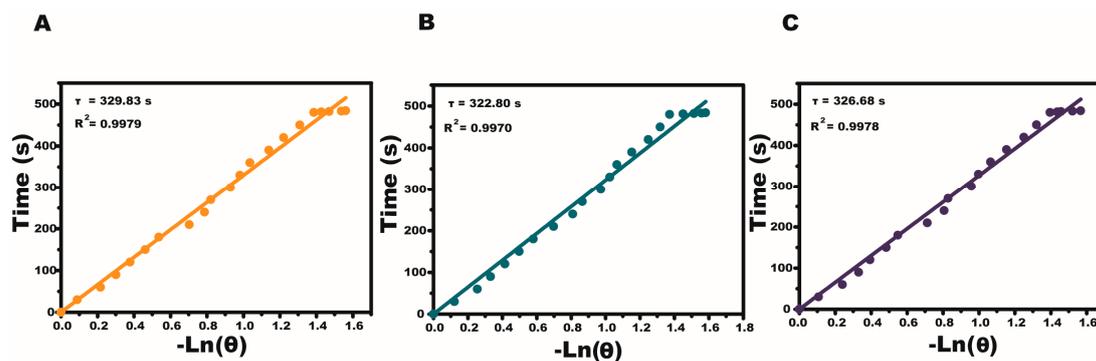

Figure S3. Determination of the time constant for heat transfer of the system. The sample system time constant (τ_s) was determined using linear regression of the cooling profile of PdPt NPs (A), PdPt@HA NPs (B) and DOX@PdPt@HA NPs (C).

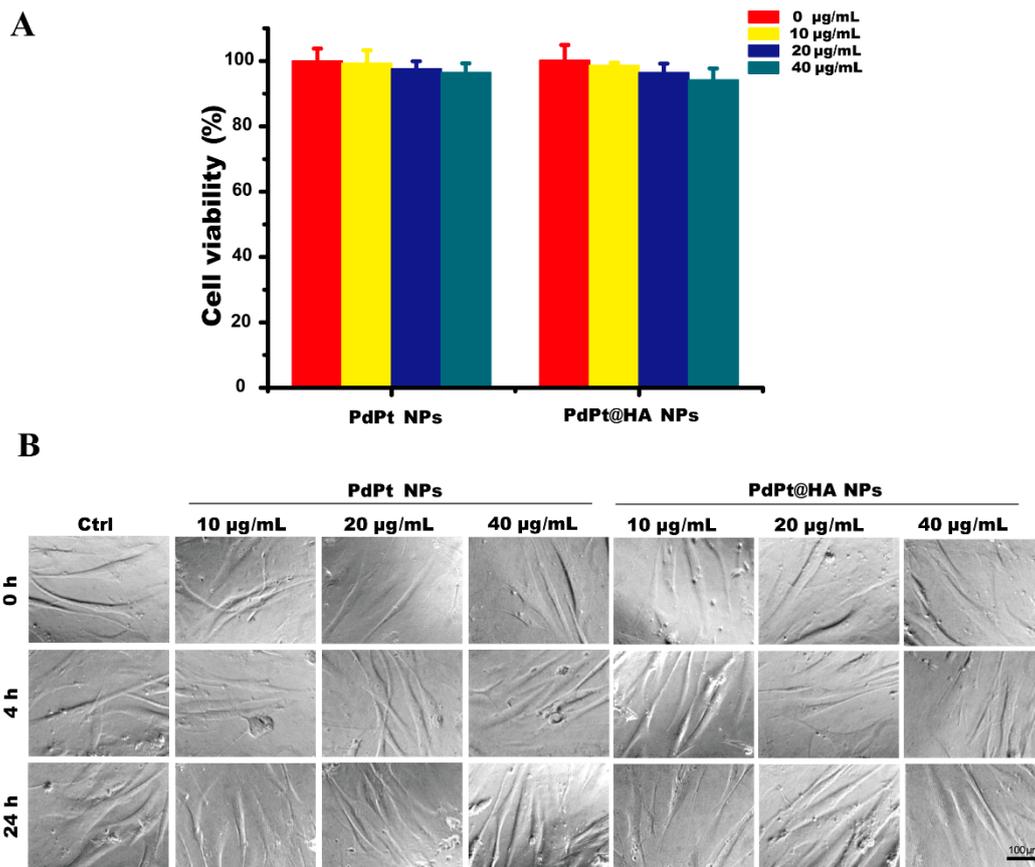

Figure S4. Cell viability of human foreskin fibroblast (HFF) cells incubated with PdPt or PdPt@HA NPs for 24h (A) and cell morphology at indicated time points (B).

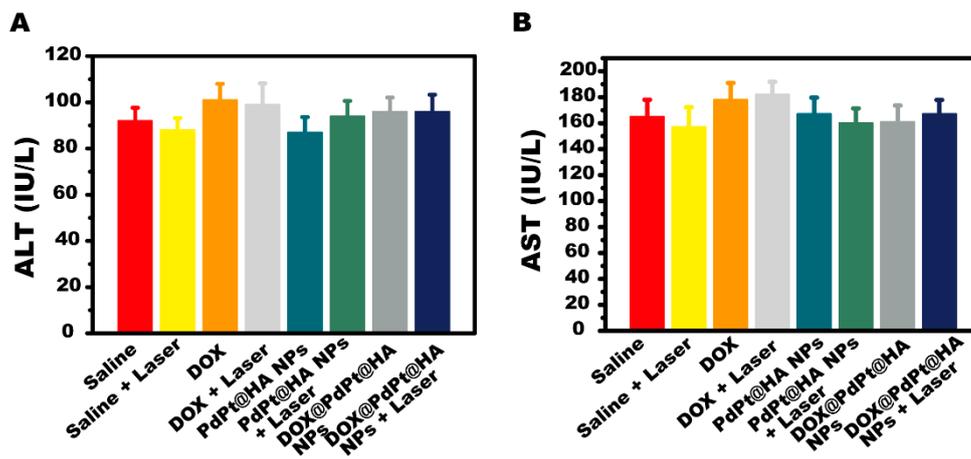

Figure S5. Levels of alanine aminotransferase (ALT) (A) and aspartate aminotransferase (AST) (B) in serum of mice were quantified for the indication of hepatotoxicity. Values represent mean \pm SE ($n = 6$ in each group).
