#### 4. Data Visualization and Interpretation

The following aspects were considered for data interpretation:

Relative (pie charts) and absolute levels (bar charts) of determined metabolites are described and interpreted. The relative profile represents the percentage of the individual metabolite relative to the total amount of metabolites (100%).

It should be noted that this study deals only with 15 (major) secondary metabolites and the formation of further metabolites is expected. These 15 analytes can be either intermediates or final products within the biosynthesis. Therefore, it can lead to a decrease of the respective metabolite level within this targeted method. In some cases, metabolite concentrations/portions are presented as the  $\sum < \text{LOD/LOQ}$ , due to lower levels and dilution steps.
