

# Supplementary Materials: Numerical Investigation of a Novel Wiring Scheme Enabling Simple and Accurate Impedance Cytometry

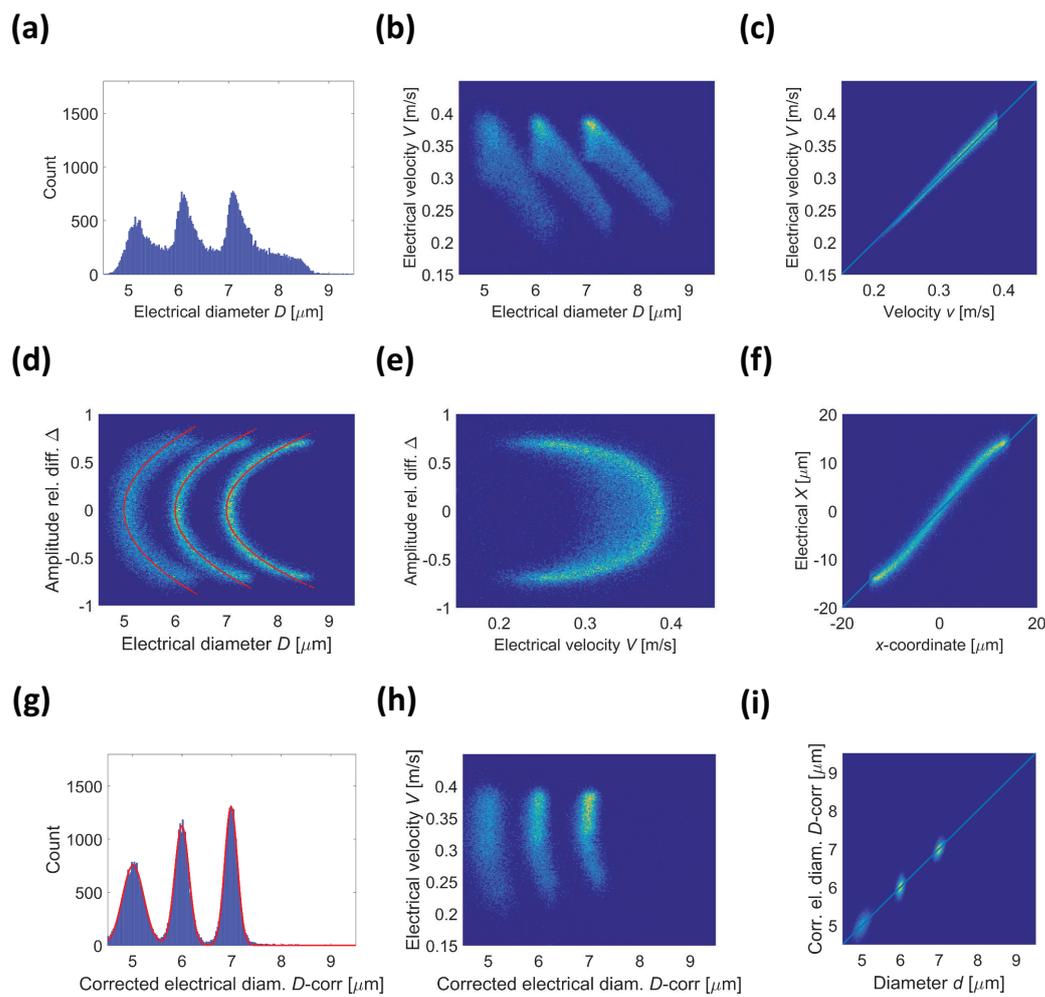

Federica Caselli \*, Riccardo Reale, Nicola Antonio Nodargi and Paolo Bisegna \*

**Figure S1.** Fitting accuracy of the asymmetric bipolar Gaussian template (Equation (1) of the main text) to the simulated traces (suspensions of 5, 6 and 7  $\mu\text{m}$  diameter beads measured separately using the proposed wiring scheme), relevant to (a) facing electrode chip and (b) coplanar electrode chip. The histogram of the root mean squared error of the fit (RMSE), normalized by the mean value of the pulse amplitude control,  $(a_1 + a_2)/2$ , is plotted, showing good fitting accuracy of the template.

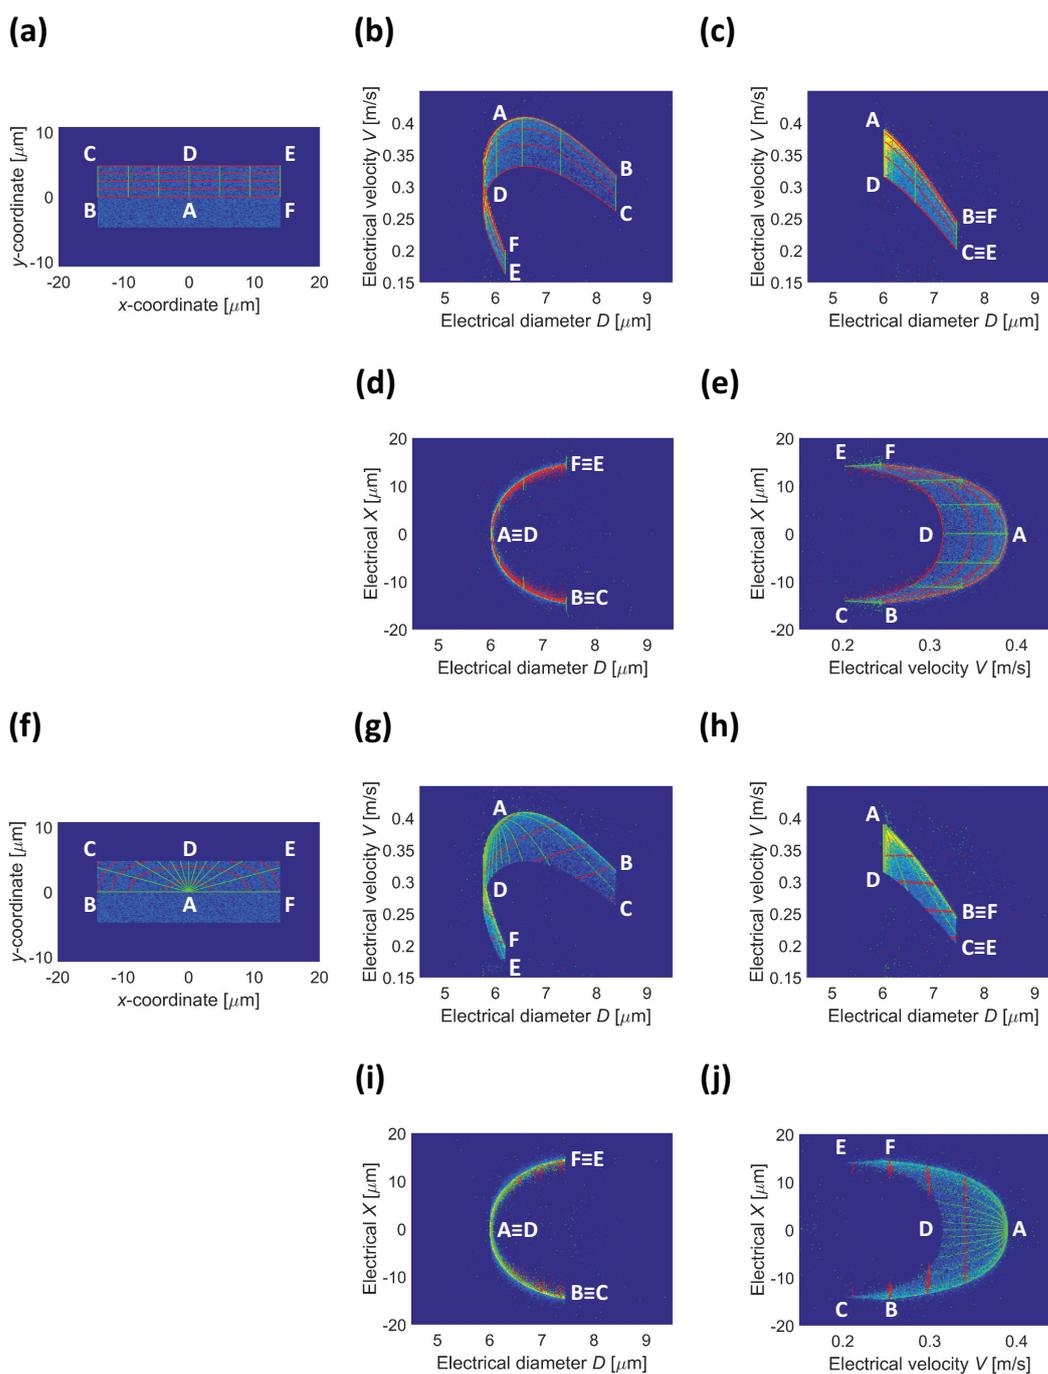

**Figure S2.** Coplanar electrode chip operated using the conventional wiring scheme. Virtual experiment relevant to a mixture of insulating beads with 5, 6 and 7  $\mu\text{m}$  diameter (data stream  $C_{\text{mix}}^{\text{conv}}$ ). (a) Histogram of the electrical diameter  $D$ ; (b) Density plot of electrical velocity  $V$  vs electrical diameter  $D$ ; (c) Density plot of electrical velocity  $V$  vs velocity  $v$  (correlation coefficient 0.66).

**Figure S3.** Coplanar electrode chip operated using the new wiring scheme. Virtual experiment relevant to a mixture of insulating beads with 5, 6 and 7  $\mu\text{m}$  diameter (data stream  $C_{\text{mix}}^{\text{new}}$ ). (a) Histogram of the electrical diameter  $D$ ; (b) Density plot of electrical velocity  $V$  vs electrical diameter  $D$ ; (c) Density plot of electrical velocity  $V$  vs velocity  $v$  (correlation coefficient 0.96); (d) Density plot of pulse amplitude relative difference  $\Delta$  vs electrical diameter  $D$ . The fitted parabolas  $D = a[1 + b(\Delta - c)^2]$  are shown as red lines (average values of parameters  $b$  and  $c$ , Table S1); (e) Density plot of pulse amplitude relative difference  $\Delta$  vs electrical velocity  $V$ ; (f) Density plot of electrical  $X$  (Equation (7) of the main text, with  $W = 40 \mu\text{m}$ ,  $\beta = 0.5$ ) vs  $x$ -coordinate (correlation coefficient 0.97); (g) Histogram of the corrected electrical diameter  $D\text{-corr}$ . Fitting a Gaussian allows the coefficients of variation (CVs) to be calculated as follows: 4.3%, 2.4%, and 1.8%, for the 5, 6, and 7  $\mu\text{m}$  diameter beads respectively; (h) Density plot of electrical velocity  $V$  vs corrected electrical diameter  $D\text{-corr}$ ; (i) Density plot of corrected electrical diameter  $D\text{-corr}$  vs diameter  $d$  (correlation coefficient 0.96).

**Table S1.** Coplanar electrode chip. Parameters of quadratic model equation  $D = a[1 + b(\Delta - c)^2]$  used to fit data plotted in Figure S3(d).

$d$ ( $\mu\text{m}$ )	$a$ ( $\mu\text{m}$ )	$b$	$c$
5.0	5.02	0.35	0.002
6.0	5.99	0.38	-0.003
7.0	6.98	0.38	-0.001
Mean	-	0.37	-0.001

**Figure S4.** Coplanar electrode chip. (a,f) Density plot of  $x$ - and  $y$ -coordinates of event centers (uniformly distributed in the channel cross-section, allowing a  $2 \mu\text{m}$  gap of the  $6 \mu\text{m}$  diameter beads from the microchannel walls). Additional events along (a) iso- $x$  and iso- $y$  lines, or (f) iso- $v$  and iso- $\theta$  lines, are marked in red and green, respectively. Six significant positions are labeled with letters from A to F. (b,g) Density plots of electrical velocity  $V$  vs electrical diameter  $D$  relevant to particle distributions in (a,d), obtained using the conventional wiring scheme (data stream  $C_6^{\text{conv}}$  in Table A1 of the main text). (c,h) Density plots of electrical velocity  $V$  vs electrical diameter  $D$  obtained using the new wiring scheme (data stream  $C_6^{\text{new}}$  in Table A1 of the main text). The latter also yields (d,i) density plots of electrical position  $X$  vs electrical diameter  $D$ , and (e,j) density plots of electrical position  $X$  vs electrical velocity  $V$ .
