

Effector Mechanisms of CD8+ HLA-DR+ T Cells in Breast Cancer Patients Who Respond to Neoadjuvant Chemotherapy

Rubén Osuna-Gómez, Cristina Arqueros, Carla Galano, Maria Mulet, Carlos Zamora, Agustí Barnadas and Silvia Vidal

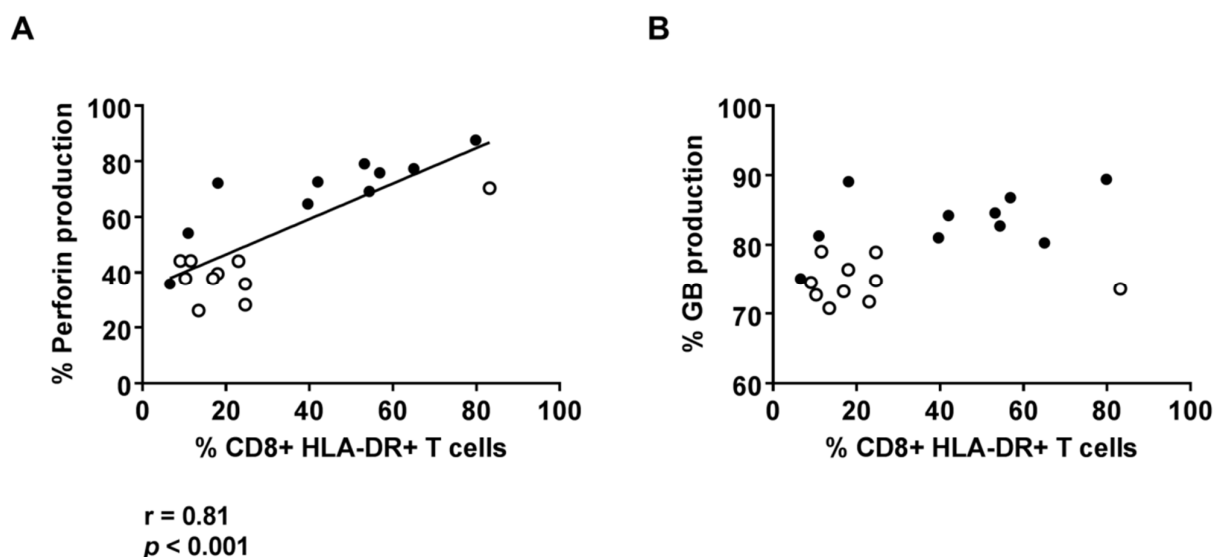

Figure S1. Correlation between CD8+ HLA-DR+ T cells in peripheral blood and the intracellular percentage of (A) perforin and (B) granzyme B production in cultured healthy donor CD8+ HLA-DR+ T cells. Spots in black correspond to R plasma and spots in white to NR plasma.

Figure S2. Cytotoxic function of CD8+ HLA-DR- T cells after a 72h-culture of HD PBMCs with 25% plasma from R ($n = 10$) and NR ($n = 10$) BC patients. (A) Percentage of CD8+ HLA-DR- T cells producing intracellular perforin and (B) granzyme B as evaluated by flow cytometry analysis.

Figure S3. Correlation between CD8+ HLA-DR+ T cells in peripheral blood and the intracellular percentage of (A) IFN- γ , (B) TNF- α and (C) IL-10 production in cultured CD8+ HLA-DR+ T cells. Spots in black correspond to R plasma and spots in white to NR plasma.

Figure S4. Intracellular cytokine production in CD8+ HLA-DR- T cells after a 72h-culture of HD PBMCs with 25% plasma from R ($n = 8$) and NR ($n = 8$). Percentages of CD8+ HLA-DR- T cells with intracellular (A) IFN- γ , (B) TNF- α and (C) IL-10 were evaluated by flow cytometry analysis.
