Intrinsic and Extrinsic Transcriptional Profiles that Affect The Clinical Response to PD-1 Inhibitors in Patients with Non-Small Cell Lung Cancer

Hye Eun Byeon ¹, Seokjin Haam ², Jae Ho Han ³, Hyun Woo Lee ⁴ and Young Wha Koh ³**Table S1.** Demographic and clinical characteristics of patients.

Variable	Adenocarcinoma (n = 31) (%)	Squamous cell carcinoma (n = 26) (%)
Age, median (range) (years)	62 (40–84)	71 (43–85)
Male sex	22 (71%)	23 (88.5%)
Smoking history	15 (68.2%)	23 (92%)
TNM stage		
III	4 (12.9%)	9 (34.6%)
IV	27 (87.1%)	17 (65.4%)
Specimen type		
Biopsy	21 (67.7%)	19 (73.1%)
Operation	10 (32.3%)	7 (26.9%)
PD-1 inhibitor		
Pembrolizumab	17 (54.8%)	16 (61.5%)
Nivolumab	14 (45.2%)	10 (38.5%)
Genetic alteration status		
EGFR-mutated	12 (40%)	0 (0%)
ALK-rearranged	0 (0%)	0 (0%)
PD-L1 expression		
>50%	22 (71%)	18 (69.2%)
Response to PD-1 blockade		
Responder	7 (22.6%)	6 (23.1%)
Non-responder	24 (77.4%)	20 (76.9%)

Smoking history was collected for 22 patients for adenocarcinoma and 25 patients for squamous cell carcinoma; EGFR test was performed for 30 patients for adenocarcinoma and 26 patients for squamous cell carcinoma.

Data S1.

The nCounter® Tumor Signaling 360 contains 760 genes and up to 20 genes can be added. Currently, the most widely used method for predicting response to PD-1 inhibitors is PD-L1 immunohistochemistry¹. Therefore, we judged that the intrinsic gene for predicting the response to PD-1 inhibitor would also be closely related to PD-L1 expression. We performed gene set enrichment analysis (GSEA) on RNA-sequencing data from cBioportal to confirm the intrinsic genes associated with PD-L1 expression². Two datasets (TCGA, Firehose Legacy and OncoSG) were used for lung adenocarcinoma, and one dataset was used for lung squamous cell carcinoma (TCGA, Firehose Legacy). In GSEA analysis, if the p value was less than 0.05 and the False Discovery Rate (FDR) was less than 0.25, the pathways were considered statistically significant. In two lung adenocarcinoma dataset, seven intrinsic pathways (KRAS_SIGNALING_UP, APOPTOSIS, HYPOXIA, EPITHELIAL_MESENCHYMAL_TRANSITION, PI3K_AKT_MTOR_SIGNALING, APICAL_SURFACE, APICAL_JUNCTION) increased expression in the PD-L1 expression upregulated group. In lung squamous cell carcinoma dataset, six intrinsic pathways (HEME_METABOLISM, REACTIVE_OXYGEN_SPECIES_PATHWAY, KRAS_SIGNALING_UP, APICAL_SURFACE, XENOBIOTIC_METABOLISM, PI3K_AKT_MTOR_SIGNALING) increased expression in the PD-L1 expression upregulated group. Each pathway contains a gene list. In lung adenocarcinoma, genes with a high rank were selected while overlapping in the TCGA and OncoSG datasets in the entire pathway. Similarly, in lung squamous cell carcinoma, a gene with a high rank in the entire pathway was selected. The finally selected genes were not included in the nCounter® Tumor Signaling 360 Panel, but 20 overlapping genes were selected from the lung adenocarcinoma and lung squamous cell carcinoma datasets. The added genes are FCER1G, LAPTM5, IKZF1, TNFRSF1B, RALB, DAPP1, IRF8, CLEC4A, EPB41L3, ADAMDEC1, PRDM1, GFPT2, CD37, ACTR3, MAP4K1, F13A1, NRP1, HBEGF, MKNK1, DCBLD2.
