

Table S1. Hyperparameters of DNN models. Description and range of each hyperparameter: learning rate - Beginning learning rate (1e-5 - 1e-1) ; optimizer - Optimization method (Adam, RMSprop); epoch - Number of trials of inner loop/epoch (1-10 for DeepSurv and DeepHit, 1-4 for nDeep and Multi-nDeep) ; p dropout - Rate of dropping out the nodes (0.0 - 0.8).

Model	Hypeparam eters	Thyroid	Gastric	Breast	Colorectal	Lung	Prostate	Liver	Kidney	Uterus- Cervical	Lymphoma

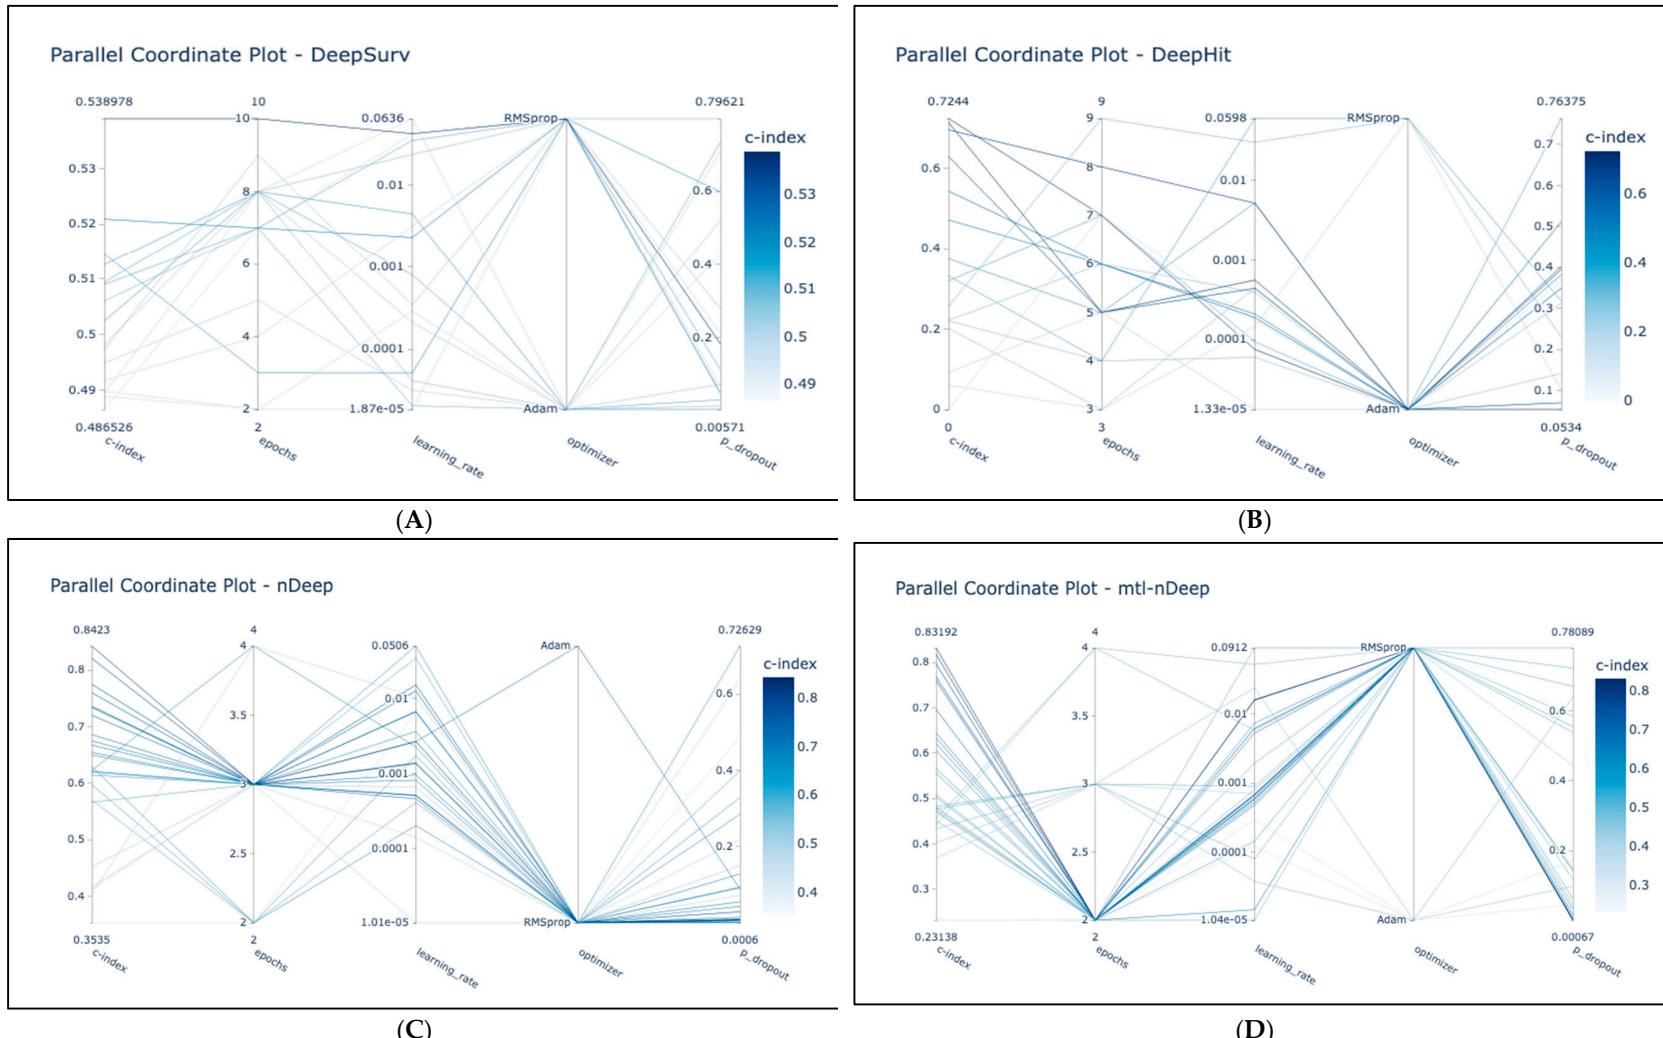

Figure S1. Hyperparameters optimization of 4 models bases on TPE algorithms. (A) DeepSurv on thyroid cancer; (B) DeepHit on prostate, liver, kidney, uterus-cervical, and lymphoma cancer; (C) nDeep on gastric cancer; (D) Multi-nDeep on breast, colorectal, and lung cancer. For multitask-learning models (Multi-nDeep and DeepHit), the mean c-index among tasks was used as the criteria for hyperparameter tuning. As can be shown, the parallel coordinate plots of nDeep and Multi-nDeep are more convergent than those of DeepSurv and DeepHit.

Table S2. C-index of each model and imputation method.

Model	Target	Imputation by mean		Imputation by median		Imputation by regression
