## 1 Synthesis of Dopamine-Flavin (DAFL):

tert-Butyl (2-((2-amino-4,5-dimethylphenyl)amino)ethyl)carbamatediamine (2):

tert-Butyl (2-bromoethyl)carbamate (1) was prepared according to the literature procedure by Luescher et al. ${ }^{1}$

4,5-Dimethylbenzene-1,2-diamine ( $1.00 \mathrm{~g}, 7.34 \mathrm{mmol}$ ) and $\mathrm{K}_{2} \mathrm{CO}_{3}(2.03 \mathrm{~g}, 14.68 \mathrm{mmol})$ were dissolved in anhydrous DMF ( 40 mL ) and heated to $50^{\circ} \mathrm{C}$ under Ar atmosphere. A solution of $1(1.65 \mathrm{~g}, 7.34 \mathrm{mmol})$ in anhydrous DMF ( 10 mL ) was then added dropwise and the resulting mixture was stirred at $50{ }^{\circ} \mathrm{C}$ overnight. DMF was removed under reduced pressure and the resulting residue was re-dissolved in DCM ( 50 mL ) and washed with water $(3 \times 50 \mathrm{~mL})$ and brine $(2 \times 50 \mathrm{~mL})$. The organic layer was then dried over anhydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and evaporated. The crude product was then purified by flash column chromatography using the solvent system cyclohexane/ethyl acetate ( $3: 2, \mathrm{v} / \mathrm{v}$ ) to give the title compound as a red residue ( $1.05 \mathrm{~g}, 3.67 \mathrm{mmol}, 50 \%$ ).

## tert-Butyl (2-(7,8-dimethyl-2,4-dioxo-3,4-dihydrobenzo[g]pteridin-10(2H)yl)ethyl)carbamate (3):

Compound $2(0.90 \mathrm{~g}, 3.22 \mathrm{mmol}), \mathrm{B}_{2} \mathrm{O}_{3}(0.45 \mathrm{~g}, 3.30 \mathrm{mmol})$ and alloxan monohydrate $(0.52 \mathrm{~g}$, $1.65 \mathrm{mmol})$ were dissolved in glacial acetic acid $(10 \mathrm{~mL})$ and left to stir in the dark at room temperature under Ar atmosphere for 18 h . Water was added ( 10 mL ) and extracted with $\mathrm{CHCl}_{3}(3 \times 20 \mathrm{~mL})$. The organic layer was evaporated and then co-evaporated with toluene $(3 \times 20 \mathrm{~mL})$ to remove any traces of water and acetic acid. The residue was then recrystallized from ethanol to afford the title compound as a dark yellow solid $(0.66 \mathrm{~g}, 1.72$ mmol, 53\%).

N -(2-(7,8-dimethyl-2,4-dioxo-3,4-dihydrobenzo[g]pteridin-10(2H)-yl)ethyl)-2-(2,2dimethylbenzo [d][1,3]dioxol-5-yl)acetamide (5):

2-(2,2-Dimethylbenzo[d][1,3]dioxol-5-yl)acetic acid (4) was prepared according to the literature procedure by Geiseler et al. ${ }^{2}$

Flavin $3(170 \mathrm{mg}, 0.44 \mathrm{mmol})$ was dissolved in chloroform ( 25 mL ) and 2 M HCl in diethyl ether ( 3 mL ) was added dropwise. The reaction mixture was stirred for 18 h at room temperature and was then concentrated in vacuo to yield the hydrochloride salt of flavin 3 as a dark yellow solid ( $140 \mathrm{mg}, 0.44 \mathrm{mmol}$ ) which was then dissolved in anhydrous DMF ( 40 mL ) with HATU ( $200 \mathrm{mg}, 0.53 \mathrm{mmol}$ ) and DIPEA ( $0.3 \mathrm{~mL}, 1.76 \mathrm{mmol}$ ) under Ar atmosphere. A solution of $4(75 \mathrm{mg}, 0.36 \mathrm{mmol})$ in anhydrous DMF $(5 \mathrm{~mL})$ was then added to the reaction mixture which was left to stir at room temperature for 18 h . DMF was removed under reduced pressure and the resulting residue was re-dissolved in DCM (50 $\mathrm{mL})$ and washed with water $(1 \times 30 \mathrm{~mL})$ and brine $(3 \times 30 \mathrm{~mL})$. The organic layer was then dried over anhydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and evaporated. The crude product was then purified by column chromatography using the solvent system $\mathrm{CHCl}_{3} / \mathrm{MeOH} / \mathrm{AcOH}(97: 2: 1, \mathrm{v} / \mathrm{v})$ to give the title compound as an orange solid ( $86 \mathrm{mg}, 0.18 \mathrm{mmol}, 50 \%$ ).

## Quantum Efficiency

The quantum efficiency of AMT degradation was estimated by first calculating the energy of 450 nm photons produced by the LED used to irradiate the reaction using the PlanckEinstein relation $\left(4.414 \times 10^{-19} \mathrm{~J}\right)$. Then the total energy per second was calculated to be 0.102 $\mathrm{Js}^{-1}$ using the irradiance of the LED used in the photoreactor ( $34 \mathrm{~mW} / \mathrm{cm}^{2}$ ) and the area of the reaction mixture in the vial $\left(3 \mathrm{~cm}^{2}\right)$. The number of photons per second emitted by the LED can then be calculated using these values ( $2.311 \times 10^{17}$ photons/s). Finally, the quantum efficiency (QE) was then estimated using the reaction rate constant divided by the number of photons per second:

| Reaction | Rate $\left(\mathbf{s}^{-1}\right)$ | QE |
| :---: | :---: | :---: |
| IONP-DAFL $\left(\mathrm{MES}, \mathrm{O}_{2}\right)$ | $3.45 \times 10^{-4}$ | $1.493 \times 10^{-21}$ |
| IONP-DAFL (EDTA, Ar) | $1.36 \times 10^{-3}$ | $5.884 \times 10^{-21}$ |

The rates of the reactions of IONP-DAFL (MES, $\mathrm{O}_{2}$ ) and IONP-DAFL (EDTA, Ar) are calculated by finding the slope of the tangent to the best fit curve of each data set as shown below. The rate is then converted from $\mathrm{h}^{-1}$ to $\mathrm{s}^{-1}$.
