Degree of crystallinity calculation:

$$\text{Crystallinity} = \frac{\text{Sum total of relative intensities of NaY observed}}{\text{Sum total of relative intensities of NaY standard}} \times 100 \%$$

Where the sum total of relative intensities taken were for the characteristic peaks (2θ 6.2°, 15.6° and 22.1°), Parent NaY was taken as the standard.

Table S1: Temperature programmed reduction results for the Ga-NaY zeolites

Catalyst	Peak Temperature (°C)	Mol of Hydrogen consumed (mol/g)
Ga-NaY	349	2,76
MgGa-NaY	383	1,31
CaGa-NaY	378	1,41
SrGa-NaY	388	0,13
BaGa-NaY	377	0,86
