List of figures:

Figure S1. Rheological characterization of CBH-3: (a) time sweep, (b) strain sweep and (c) frequency sweep (same characterization done for all the investigated hydrogels).

Figure S2. Rheological characterization of CBH versus KOH concentration: (a) strain sweeps (linear viscoelastic regime) and (b) frequency sweeps (linear modulus plateau).

Figure S3. Rheological characterization of CBH versus the HEC-DVS ratio: (a) strain sweeps (linear viscoelastic regime) and (b) frequency sweeps (linear modulus plateau).

Figure S4. Assessment of the feasibility of the CBH for flexible ECDs: (a) Digital images of the colored devices comprising optimized cellulose-based EC hydrogel in bended state; (b) Digital images of the ECD on the bleached state (b.1: OFF) and its colored state before (b.2) and after (b.3) 50 cycles of bending; (c) Transmittance spectra of the ECD in its bleached state (OFF) and at its colored state before and after bending.

Figure S5. Schematic representation of a printed Zinc/MnO₂ battery.

Figure S6. Galvanostatic discharge curves of printed battery with CBH-3 electrolyte.

Figure S7. Electrochemical Spectroscopy Impedance (Nyquist plots) of CHB-3 and 1M ZnCl₂ swelled CBH-3 electrolytes.

Figure S8. Digital photographs of the effect of the addition of ZnCl₂ (1 M) to 2 wt. % of CMC (left) and to 20 mM of KOH (right).

Figure S9. Digital photographs of CBH-3 membranes (a) as made (b) after drying at 70 °C and (c) after swelled with 1M ZnCl₂ over 180 minutes.

Figure S10. Galvanostatic discharge curve at 50 μ A of printed battery with a Whatman separator soaked in 1M ZnCl₂ electrolyte.

List of tables:

Table S1. Transmittance (%) at 550 nm and transmittance changes ($\Delta\%T$) of ECDs comprising optimized self-standing cellulose-based EC hydrogel at different applied potentials.

Table S2. Color coordinates of ECDs comprising optimized self-standing cellulose-based EC hydrogel at bleached (off) and colored states (-2.4 V).

Table S3. Bending test of flexible ECDs: transmittance (%) at 550 nm and transmittance changes ($\Delta\%T$) of flexible ECDs comprising optimized cellulose-based hydrogel before and after bending test (50 cycles).

Figure S1. Rheological characterization of CBH-3: (a) time sweep, (b) strain sweep and (c) frequency sweep (same characterization done for all the investigated hydrogels)

Figure S2. Rheological characterization of CBH versus KOH concentration at a ratio HEC to DVS of 50 : 50: (a) strain sweeps (linear viscoelastic regime) and (b) frequency sweeps (linear modulus plateau).

Figure S3. Rheological characterization of CBH versus the HEC-DVS ratio in 20 mM KOH: (a) strain sweeps (linear viscoelastic regime) and (b) frequency sweeps (linear modulus plateau).

Table S1. Transmittance (%) at 550 nm and transmittance changes ($\Delta\%T$) of ECDs comprising optimized self-standing cellulose-based EC hydrogel at different applied potentials.

Potential (V)	%T ($\lambda = 550$ nm)	$\Delta\%T$ ($\lambda = 550$ nm)
OFF	67.5	-
-1.2 V	38.0	29.4
-1.4 V	30.8	36.6
-2.0 V	25.9	41.6
-2.2 V	16.6	50.8
-2.4 V	11.7	55.8

Table S2. Color coordinates of ECDs comprising optimized self-standing cellulose-based EC hydrogel at bleached (off) and colored states (-2.4 V).

Potential (V)	x ^(a)	y ^(a)	Y ^(a)	L* ^(b)	a* ^(b)	b* ^(b)	Color ^(c)
OFF	0.316	0.332	68.318	86	0	2	
-2.4 V	0.287	0.215	15.396	46	32	-31	

Table S3. Bending test of flexible ECDs: transmittance (%) at 550 nm and transmittance changes ($\Delta\%T$) of flexible ECDs comprising optimized cellulose-based hydrogel before and after bending test (50 cycles).

Potential (V)	%T ($\lambda = 550$ nm)	$\Delta\%T$ ($\lambda = 550$ nm)
OFF	64,4	-
ON	26,0	38,4
ON-after bending	25,5	39,0

Figure S4. Assessment of the feasibility of the CBH for flexible ECDs: (a) Digital images of the colored devices comprising optimized cellulose-based EC hydrogel in bended state; (b) Digital images of the ECD on the bleached state (b.1: OFF) and its colored state before (b.2) and after (b.3) 50 cycles of bending; (c) Transmittance spectra of the ECD in its bleached state (OFF) and at its colored state before and after bending.
