Synthesis of methacrylic-modified dopamine (DA)

Methacrylic-modified dopamine was synthesized following the protocol outlined in the literature [S1]. The synthesis involved the reaction of 3,4-dihydroxyphenethylamine hydrochloride with methacrylate anhydride in an aqueous solution of sodium borate and sodium bicarbonate under moderately basic conditions. The presence of aqueous sodium borate solution, serving as the reaction medium, played a role in protecting the dopamine moiety by forming a borate ester. The synthesized DA monomer was gained as a solid pale-gray powder with a yield of 14%. ¹H NMR (400 MHz, D₂O): δ 1.71 (s, 3H), 2.59 (t, *J* = 6.8 Hz, 2H), 3.31 (t, *J* = 6.8 Hz, 2H), 5.24 (s, 1H), 5.41 (s, 1H), 6.57 (dd, *J* = 2.0, 8.0 Hz, 1H), 6.65 (d, *J* = 2.0 Hz, 1H), 6.72 (d, *J* = 8.0 Hz, 1H).

Table S4 Summarized t-test table of p-values for cell viability.

T-test	p-value (DAY 1)	p-value (DAY 3)	p-value (DAY 7)
PAID-0 vs Control	0.030	0.150	0.286
PAID-1 vs Control	0.129	0.103	0.048
PAID-2 vs Control	0.232	0.436	0.073
PAID-3 vs Control	0.194	0.098	0.064

P-values of <0.05 mean that there is a significant difference between the groups.
