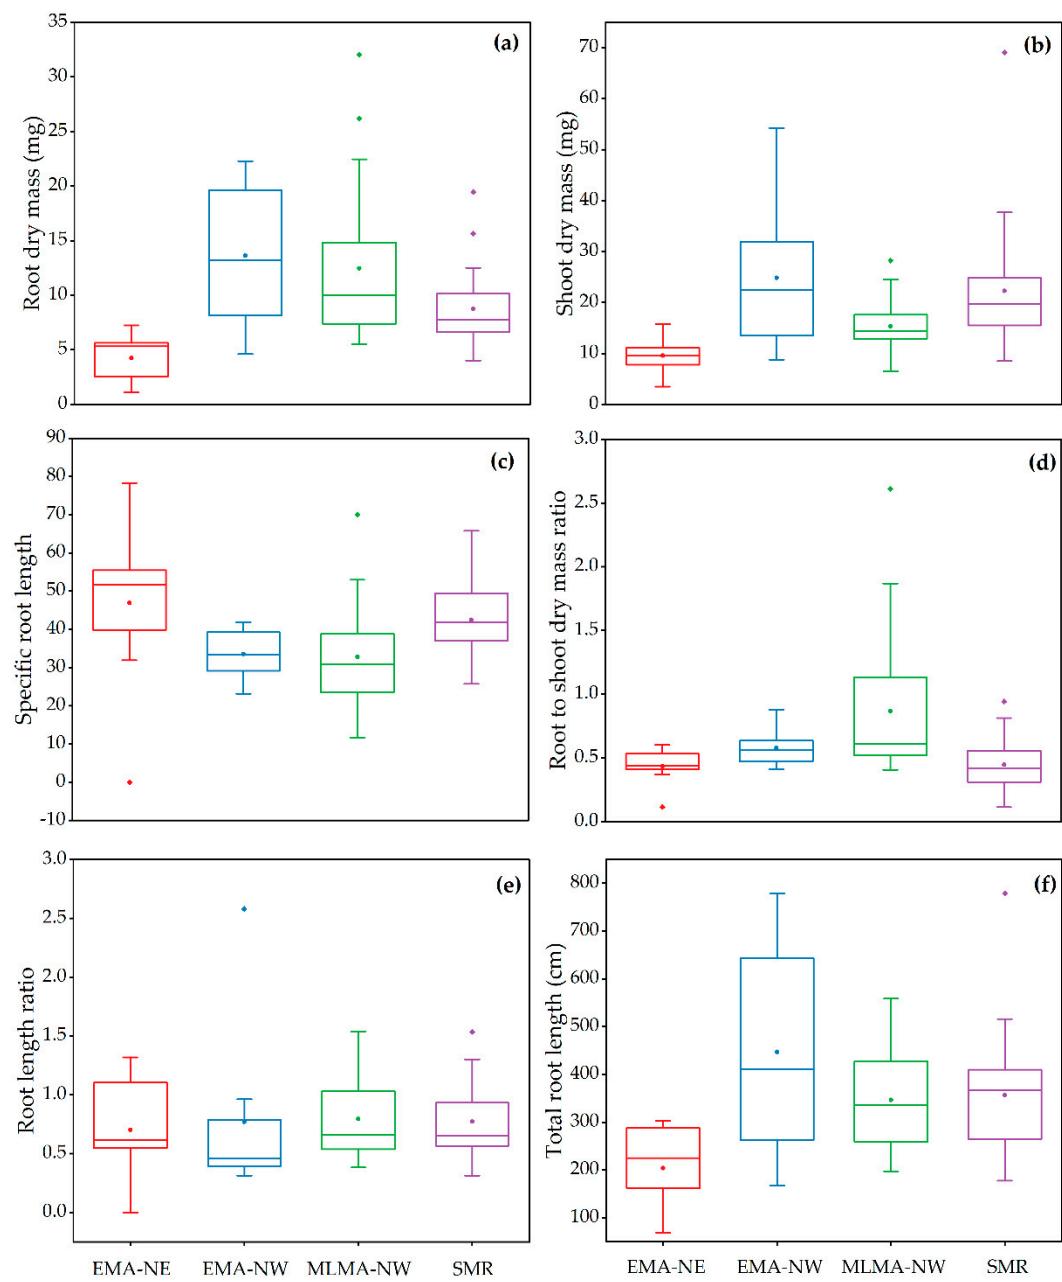

Figure S1. Variations of root and shoot phenotypes among the 4 ecological regions: (a) root dry mass; (b) shoot dry mass; (c) specific root length; (d) shoot to shoot dry mass ratio; (e) root length ratio; (f) total root length.

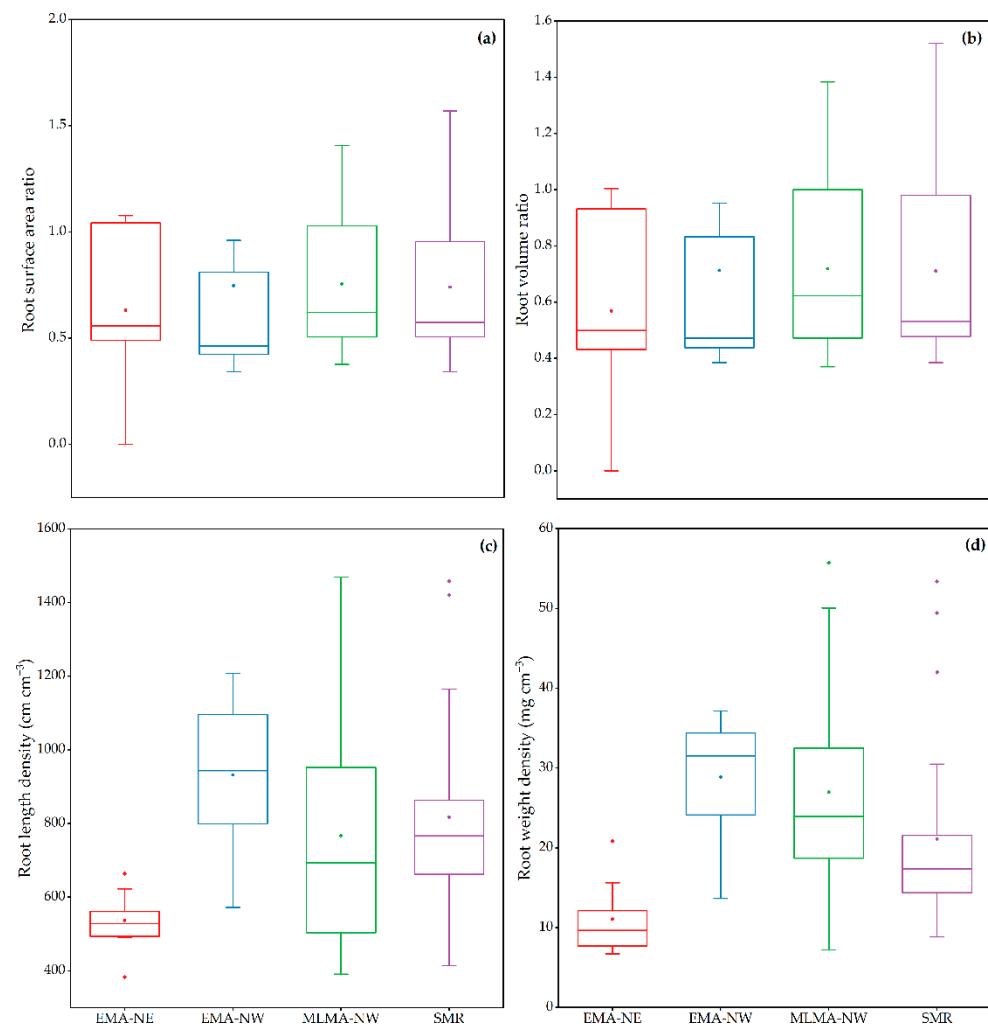

Figure S2. Variations of root phenotypic among the 4 ecological regions: (a) root surface area ratio; (b) root volume ratio; (c) root length density; (d) root weight density.

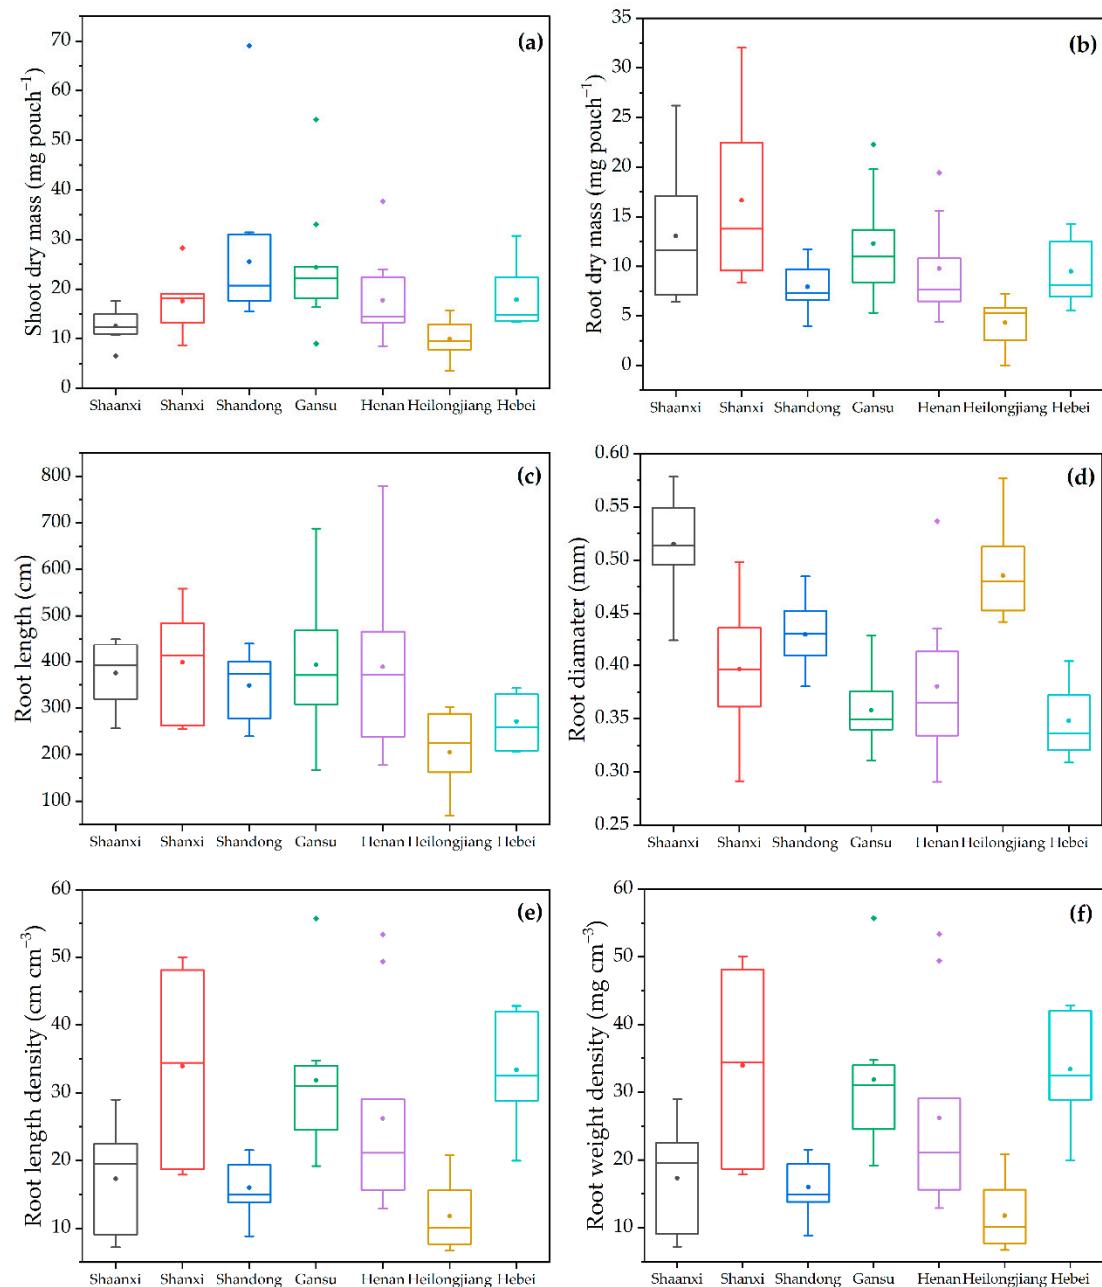

Figure S3. Variations of root and shoot phenotypes traits in the 7 provinces: (a) shoot dry mass; (b) root dry mass; (c) root length; (d) root diameter; (e) root length density; (f) root weight density.

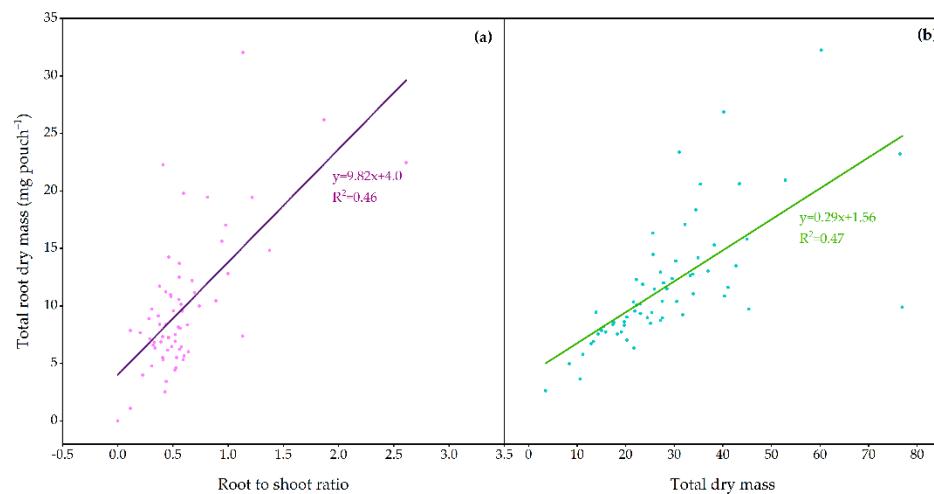

Figure S4. Linear fitting of root phenotypes: (a) total root dry mass vs. root to shoot ratio; (b) root dry mass vs. total dry mass.

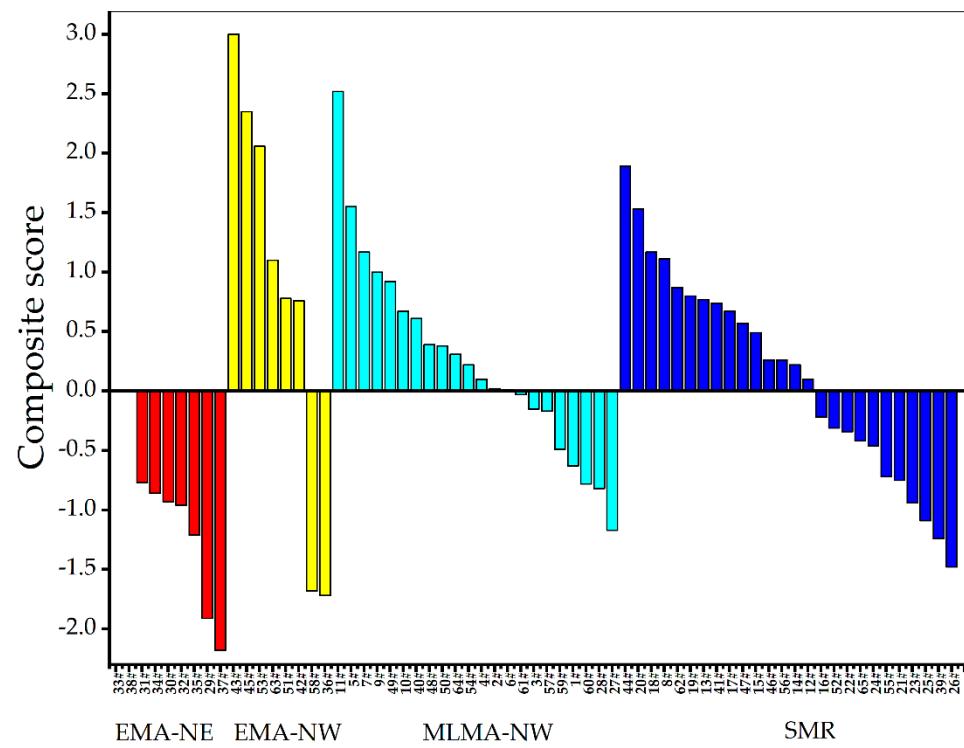

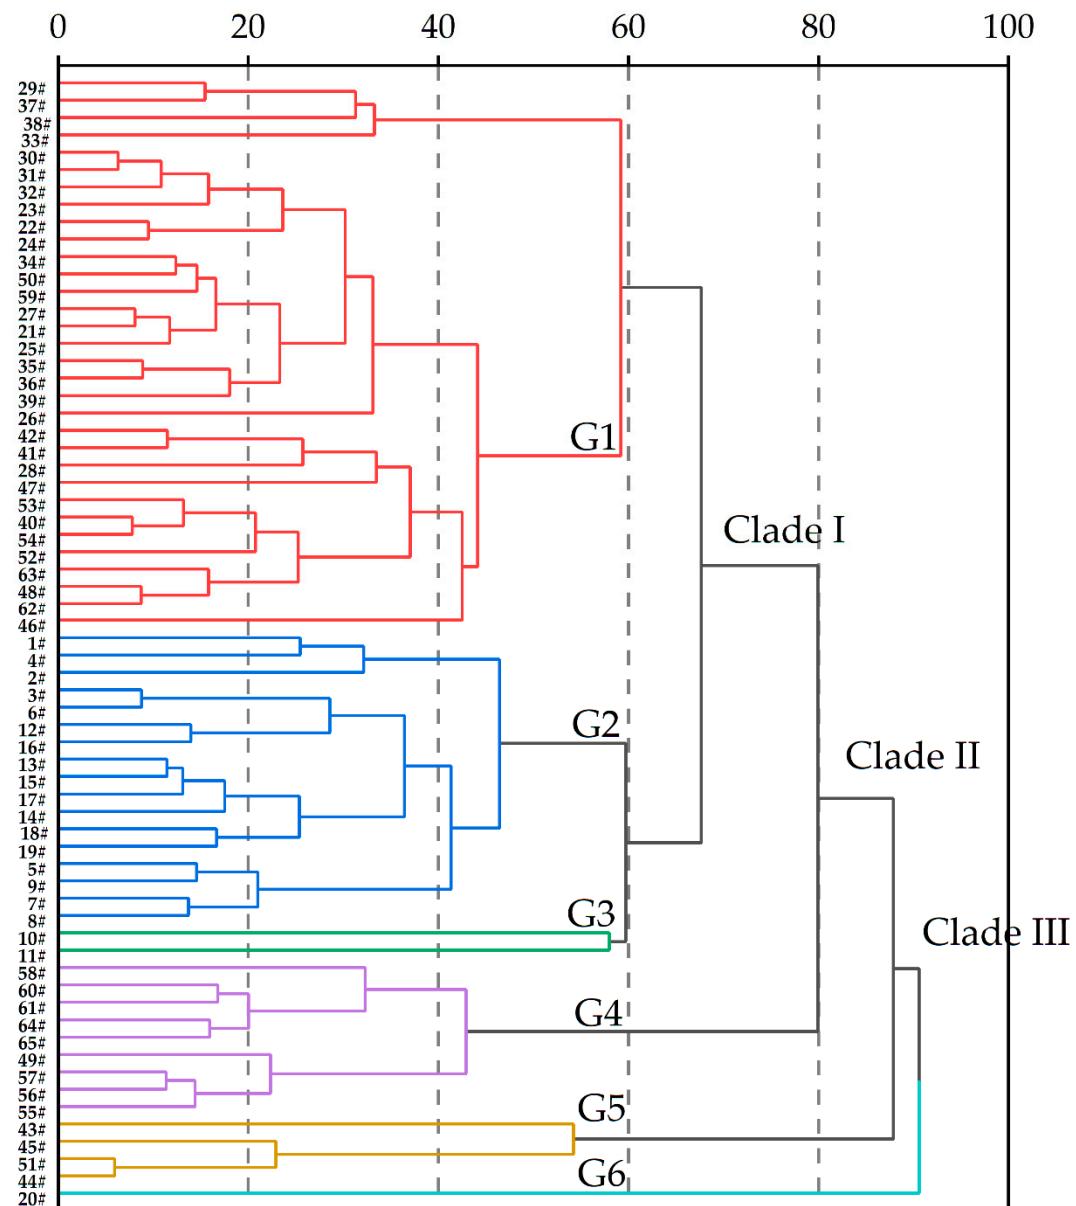

Figure S5. Comprehensive values of 18 selected traits. Comeposite score sorted from small to large, divided by ecological regions.

Figure S6. Dendrogram of agglomerative hierarchical clustering (AHC) on 18 selected root traits. The 65 millet genotypes were assigned to one of three general clades (Clade I, Clade II and Clade III) at a rescaled distance of 80 containing six groups (G1 to G6) at a rescaled distance 60.
