Photosystem II Tolerance to Excess Zinc Exposure and High Light Stress in *Salvia sclarea*

Michael Moustakas [1,*], Anelia Dobrikova [2], Ilektra Sperdouli [3], Anetta Hanć [4], Julietta Moustaka [5], Ioannis-Dimosthenis S. Adamakis [6] and Emilia Apostolova [2]

Table S1. Definitions of the chlorophyll fluorescence parameters used in the experiments

Parameter	Definition	Calculation
F*v*/F*m*	Maximum efficiency of PSII photochemistry	(F*m* − F*o*)/F*m*
Φ_{PSII}	Effective quantum yield of PSII photochemistry	(F*m'* − F*s*)/F*m'*
Φ_{NPQ}	Quantum yield of regulated non-photochemical energy loss in PSII	F*s*/F*m'* − F*s*/F*m*
Φ_{NO}	Quantum yield of nonregulated energy loss in PSII	F*s*/F*m*
F*v'*/F*m'*	Efficiency of open PSII reaction centers	(F*m'* – F*o'*)/F*m'*
F*v*/F*o*	Efficiency of the oxygen evolving complex (OEC) on the donor side of PSII	(F*m* − F*o*)/F*o*
ETR	Electron transport rate	Φ_{PSII} × PAR × c × abs, where PAR is the photosynthetically active radiation, c is 0.5, and abs is the total light absorption of the leaf taken as 0.84
q*p*	Photochemical quenching, representing the redox state of quinone A (Q_A), or in other words the fraction of PSII reaction centers in open state based on the "puddle" model for the photosynthetic unit	(F*m'* − F*s*)/(F*m'* – F*o'*)
NPQ	Non-photochemical quenching reflecting the dissipation of excitation energy as heat	(F*m* – F*m'*)/F*m'*
EXC	Excess excitation energy	(F*v*/F*m* − Φ_{PSII})/F*v*/F*m*
